

Slide 1

Administrivia

- Reminder: Homework 4 due Monday.
- Homework 5 on Web, due next Friday *at class time*. (This is so I can distribute a solution.)
- Notice (small) addition to reading.
- Talk by visiting scholar Prof. Abelson Monday at 4pm in Chapman. Bonus attendance points if you attend.

Slide 2

Solving Recurrence Relations, Review

- Idea is to come up with “closed-form” (non-recursive) equivalent of recursive definition of sequence. Two approaches:
 - “Expand, guess, verify”.
 - Formula (works for first-order linear recurrence relations only).
- One more example — section 2.4 problem 80.

Analysis of Algorithms, Overview

Slide 3

- Often there's more than one way to solve a given problem, i.e., more than one algorithm. Which one is "best"? Depends on what "best" means. If we mean "fastest":
- A useful measure of approximate execution time is worst-case (or sometimes average-case) execution time expressed as a function of "problem size" (e.g., for operations on array, size of array) — "time complexity" of algorithm. (Another measure is "space complexity".)
- Customary to skip over housekeeping operations and count only "important stuff" — arithmetic operations, comparisons, etc.
Also customary to "round off" the estimate to an "order of magnitude" — for a problem of size N , we say an algorithm is $O(f(N))$ if execution time is $f(N)$.

Analysis of Algorithms, Examples

Slide 4

- Example — computing a sum of N numbers. How many additions?
- Example — sequential search of array of size N . How many comparisons (worst case)?
- Example — binary search of sorted array of size N . How many comparisons (worst case)?

Analysis of Algorithms, Longer Example

- Look at several algorithms for computing a^b , for b a positive integer. First version:

```
double exp(double a, int b) {
    double temp = a;
    for (int i = 1; i < b; ++i)
        temp *= a;
    return temp;
}
```

Slide 5

First, does this work? yes, and notice we could argue that it does using a loop invariant (what?).

- How many multiplications needed?

Analysis of Algorithms, Longer Example Continued

- We could also express this recursively:

```
double exp(double a, int b) {
    if (b == 1)
        return a;
    else
        return a * exp(a, b-1);
}
```

Slide 6

Does this work? (Yes. Why?)

- How to figure out how many multiplications? Define and solve a recurrence relation.

Analysis of Algorithms, Longer Example Continued

- We could also express this recursively another way:

```
double exp(double a, int b) {
    if (b == 1)
        return a;
    else {
        double temp = exp(a, b/2);
        if (b % 2 == 0)
            return 1 * temp * temp; // extra "*", yes
        else
            return temp * temp * a;
    }
}
```

Slide 7

Does this work? (Yes. Why?)

- How to figure out how many multiplications? Define and solve a recurrence

relation. (To be continued.)

Slide 8

Minute Essay

- Given a simpler recurrence relation:

$$P(1) = 500$$

$$P(n) = P(n - 1) * 1.1, \text{ for } n > 1$$

Slide 9

What is a closed-form solution? (Okay to guess.)
