

# Text I/O and Files

9/28/2007

# Opening Discussion

- Let's look at solutions to the interclass problem.
- Do you have any questions about the assignment?

# Why Files?

- This should be an easy one. As you know, when a program stops running all the memory is lost and anything that you haven't written to disk is lost.
- In Linux we can get some file access through I/O redirection, but then reading from a file means no keyboard input and writing to a file means nothing comes up on screen.
- We'd like to be able to use files for reading and writing in addition to the standard input and output.

- Constructs that allow us to do input and output are referred to generally as streams.
- In C we have text and binary streams and they are represented by the type `FILE *`. `FILE` is something defined in `stdio.h` and the `*` means it is a pointer.
- The `stdio` library also defines several streams for us: `stdin`, `stdout`, and `stderr`. We can use these to refer to standard input, output, and error.

- When we want to work with files we have to get hold of streams connected to the files. We do this with the `fopen` function. Let's look at `man` to see how it works.
- The first argument to `fopen` is the name of the file. The second argument is what we intend to do with it.
  - ◆ Mode can be `w`, `a`, or `r` for write, append, or read. A `+` with `w` or `r` tells it to allow both.
  - ◆ Style can be `t` or `b` for text or binary.
- After you are done using a stream that you get with `fopen` you need to close it with `fclose`.

- When you are working with files you use `fprintf` and `fscanf` instead of the regular `printf` and `scanf`.
- They work the same way, but take an extra argument. The first thing you pass them needs to be the `FILE *` of the stream you want to use.
- Note that `fprintf(stdout,...)` does exactly the same thing `printf` does and `fscanf(stdin,...)` does what `scanf` does.
- This way you can write a function that does formatted I/O and have it take a stream then use it either for files, keyboard input, or screen output.

- How confident do you feel about the midterm right now?
- Remember to turn in assignment #3 by midnight tonight.
- Interclass Problem – Write a program that reads numbers from a file called numbers.txt. It should write numbers out to files called even.txt and odd.txt with the appropriate numbers going to each one.
