

XML

11-14-2011

Opening Discussion

- Minute essay comments:
 - Can you write web pages using XML?
 - Discrete and 1120 in the major/minor.
 - FYs in 3194. Role of 3194.
 - ASIMO is made by Honda, not sponsored.
 - What were my influences for CS?
 - What is the wackiest programming error I've ever seen?
 - Assignment #2 grades should be expected this week.

Motivation

- We have been using “flat” text files to store things.
- Advantage: it is human readable and simple.
- Disadvantages: everything else.
 - Slow
 - Large
 - Lacks meaning
 - Hard to edit
 - Hard to debug

XML

- The eXtensible Markup Language (XML) is a standard for text encoding of data.
- If you have ever done HTML, XML is similar. XHTML is HTML that follows the XML standard.
- The advantage of XML is that it can encode pretty much anything and it is human readable text.
- The downside is that it can be very verbose.
- Composed of markup (between < and > or & and ;) or content (anything not markup).

Tags

- The primary markup used in XML is the tag.
- A tag begins with a `<` and ends with a `>`.
- There are three types of tags.
 - Start-tag: `<student>`
 - End-tag: `</student>`
 - Empty-element tag: `<quiz/>`

Elements

- The structure of XML documents comes primarily from elements.
- An element is one of the following:
 - Everything from a start-tag to the matching end-tag.
 - An empty-element tag.
- Elements have to be properly nested. The nesting can imply information.

Attributes

- An attribute is a name value pair.
- They can be put in start-tags or empty-element tags.
- Examples:
 - `<student name="Jason" id="0123456">`
 - `<quiz grade="55"/>`

XML Declaration

- An XML file can begin with a declaration telling information about it.
 - `<?xml version="1.0" encoding="UTF-8" ?>`
- We won't worry about these in this class.

XML in Scala

- The Scala language supports XML at the language level.
- Go to the REPL and enter some XML.
- There is a `scala.xml` package that contains the libraries for XML.
 - The `NodeSeq`, `Node`, and `Elem` types are particularly useful. I'll typically just use the word `Node` to describe something from the XML.
 - So is the `XML` object.

The XML Object

- The loadFile method can be passed a file name and it will read in the file and return a NodeSeq that allows you to get to the contents.
- There is also a save method that takes a file name and an XML node and writes it to file.

Using \ and \\

- Use the \ operation on a node to search for the occurrences of something at the top level.
- The second argument is a string.
 - Normal string searches for tags with that label.
 - If the string starts with @ it searches for attributes.
- Use \\ to search deeply.

Minute Essay

- Questions about XML?
- Valero will be presenting at the ACM meeting starting at 4:30.
