Andreas Schlechte§
2004/09/20

Abstract

\texttt{ntheorem.sty} is a package for handling theorem-like environments. Additionally to several features for defining the layout of theorem-like environments which can be regarded to be standard requirements for a theorem-package, it provides solutions for two related problems: placement of endmarks and generation of lists of theorem-like environments.

In contrast to former approaches, it solves the problem of setting endmarks of theorem-like environments (theorems, definitions, examples, and proofs) \textit{automatically} at the right positions, even if the environment ends with a \texttt{displaymath} or (even nested) list environments, it also copes with the \texttt{amsmath} package. This is done in the same manner as the handling of labels by using the \texttt{.aux} file.

It also introduces the generation of lists of theorem-like environments in the same manner as \texttt{listoffigures}. Additionally, more comfortable referencing is supported.

After running \LaTeX{} several times (depending on the complexity of references, in general, three runs are sufficient), the endmarks are set correctly, and theoremlists are generated.

Since \texttt{ntheorem.sty} uses the standard \LaTeX{} \texttt{\newtheorem} command, existing documents can be switched to \texttt{ntheorem.sty} without having to change the \texttt{.tex} file. Also, it is compatible with \LaTeX{} files using \texttt{theorem.sty} written by Frank Mittelbach.

1 Introduction

For our purposes here, “theorems” are labelled enunciations, often set off from the main text by extra space and a font change. Theorems, corollaries, conjectures, definitions, examples, remarks, and proofs are all instances of “theorems”. The “header” of these structures is composed of the type of the structure (such as `THEOREM` or `REMARK`), a number which serializes the instances of the same type throughout the document, and an optional name (such as “Correctness Theorem”). The layout of theorems can be changed by parameters as the fonts of the header and the body, the way how to arrange the headers, the indentation, and the way of numbering it. Confronted with these requirements, `theorem.sty`, a style for dealing with theorem layout was developed by Frank Mittelbach which was the standard theorem-environment for long time.

But then the desire for additional features like “endmarks” and “theorem-lists” arose. Two extensions of `theorem.sty` were developed: One for handling endmarks, `thmmarks.sty` and one for generating lists, `newthm.sty`. Thus, Frank Mittelbach suggested to combine the new features into one “standard-to-be” package. And now, here it is.

2 The User-Interface

2.1 How to include the package

The package `ntheorem.sty` is included by

\usepackage[(options)]{ntheorem},

\...

\end{document}
where the optional parameter \textit{options} selects predefined configurations and special requirements.

The following \textit{options} are available by now, concerning partially independent issues:

\textbf{Predefined environments:} (see Section 2.3.6) With \texttt{[standard]} and \texttt{[noconfig]}, it can be chosen, if and what file is used for activating a (user-defined) standard set of theorem environments.

\textbf{Fancy boxes around theorems:} The \texttt{[framed]} option allows to use \texttt{framed.sty} that provides boxes even across pagebreaks.

\textbf{Activation of endmarks:} \texttt{[thmmarks]} enables the automatical placement of endmarks (see 2.3); when using the \texttt{amsmath}-package, \texttt{[thmmarks]} must be complemented by \texttt{[amsmath]} (see Section 3.2).

\textbf{Activation of extended reference features:} \texttt{[thref]} enables the extended reference features (see Section 4.1); when using the \texttt{amsmath}-package, \texttt{[thref]} must be complemented by \texttt{[amsmath]} (see Section 3.2).

\textbf{Compatibility with amsthm:} option \texttt{[amsthm]} provides compatibility with the theorem-layout commands of the \texttt{amsthm}-package (see Section 3.2).

\textbf{Compatibility with hyperref:} option \texttt{[hyperref]} provides compatibility with the \texttt{hyperref}-package (see section 3.4).

\section{Defining New Theorem Sets}

The syntax and semantics is exactly the same as in standard \LaTeX: the command \texttt{\newtheorem} defines a new “theorem set” or “theorem-like structure”. Two required arguments name the new environment set and give the text to be typeset with each instance of the new “set”, while an optional argument determines how the “set” is enumerated:

\begin{verbatim}
\newtheorem{foo}{bar}  The theorem set foo (whose name is bar) uses its own counter.
\newtheorem{foo2}{foo}\[bar2]}  The theorem set foo2 (printed name bar2) uses the same counter as the theorem set foo.
\newtheorem{foo3}{bar}{section}  The theorem set foo3 (printed name bar) is enumerated within the counter section, i.e. with every new \texttt{\section} the enumeration begins again with 1, and the enumeration is composed from the section-number and the theorem counter itself.
\end{verbatim}

For every environment \texttt{(name)} defined by \texttt{\newtheorem}, two environments \texttt{(name)} and \texttt{(name*)} are defined. In the main document, they have exactly the same effect, but the latter causes no entry in the respective list of theorems (cf. \texttt{\section} and \texttt{\section*}), see also Section 2.4.

\texttt{\renewtheorem} Theorem sets can be redefined by \texttt{\renewtheorem}, with the same arguments as explained for \texttt{\newtheorem}. When redefining a theorem set, the counter is not re-initialized.
2.3 Defining the Layout of Theorem Sets

For theorem-like environments, the user can set parameters by setting several switches and then calling \newtheorem. The layout of a theorem set is defined with the values of the switches at the time \newtheorem is called.

2.3.1 Common Parameters for all Theorem Sets

These additional parameters affect the vertical space around theorem environments: \theorempreskipamount and \theorempostskipamount define, respectively, the spacing before and after such an environment. These parameters apply for all theorem sets and can be manipulated with the ordinary length macros. They are rubber lengths, ('skips'), and therefore can contain plus and minus parts.

2.3.2 Parameters for Individual Sets

The layout of individual theorem sets can be further determined by switches controlling the appearance of the headers and the header-body-layout:

- \theoremstyle\{style\}: The general structure of the theorem layout is defined via its \theoremstyle. \theorem provides several predefined styles including those of Frank Mittelbach’s theorem.sty (cf. Section 2.3.4. Additional styles can be defined by \newtheoremstyle (cf. Section 2.5.1).

- \theoremheaderfont\{fontcmds\}: The theorem header is set in the font specified by \{fontcmds\).
  In contrast to theorem.sty, \theoremheaderfont can be set individually for each environment type.

- \theorembodyfont\{fontcmds\}: The theorem body is set in the font specified by \{fontcmds\).

- \theoremseparator\{thing\}: \{thing\} separates the header from the body of the theorem-environment. E.g., \{thing\} can be ‘;’ or ‘.’.

- \theoremprework\{thing\}: \{thing\} is performed before starting the theorem structure. E.g., \{thing\} can be \hrule.

- \theorempostwork\{thing\}: \{thing\} is performed after finishing the theorem structure. E.g., \{thing\} can be \hrule.

- \theoremindent\{dimen\} can be used to indent the theorem wrt. the surrounding text.
  ! It’s a ‘\{dimen\}’, so the user shouldn’t try to specify a plus or minus part, because this leads to an error.

- \theoremmultline\{style\} specifies the appearance of the numbering of the theorem set. Possible \{styles\} are arabic (default), alph, Alph, roman, Roman, greek, Greek, and fnsymbol.
  Clearly, if a theorem-environment uses the counter of another environment type, also the numbering style of that environment is used.
\theoremsymbol\{thing\}: This is only active if \texttt{ntheorem.sty} is loaded with option [thmmarks]. \texttt{(thing)} is set as an endmark at the end of every instance of the environment. If no symbol should appear, say \texttt{\theoremsymbol{}}.

The flexibility provided by these command should relieve the users from the ugly hacking in \texttt{\newtheorem} to fit most of the requirements stated by publishers or supervisors.

\theoremc\ With the command \texttt{\theoremc\{(theorem-type)\}} (where \texttt{(theorem-type)} must be an already defined theorem type), these parameters can be set to the values which were used when \texttt{\newtheorem} was called for \texttt{(theorem-type)}.

With \texttt{\theoremc\{LaTeX\}}, the standard \LaTeX{} layout can be chosen.

2.3.3 Font Selection

From the document structuring point of view, theorem environments are regarded as special parts inside a document. Furthermore, the theorem header is only a distinguished part of a theorem environment. Thus, \texttt{\theoremheaderfont} inherits characteristics of \texttt{\theorembodyfont} which also inherits in characteristics of the font of the surrounding environment. Thus, if for example \texttt{\theorembodyfont} is \texttt{\itshape} and \texttt{\theoremheaderfont} is \texttt{\bfseries} the font selected for the header will have the characteristics ‘bold extended italic’. If this is not desired, the corresponding property has to be explicitly overwritten in \texttt{\theoremheaderfont}, e.g. by \texttt{\theoremheaderfont\{\normalfont\bfseries\}}

2.3.4 Predefined theorem styles

The following theorem styles are predefined, covering those from \texttt{\theorem.sty}:

- **plain** This theorem style emulates the original \LaTeX{} definition, except that additionally the parameters \texttt{\theorem...skipamount} are used.

- **break** In this style, the theorem header is followed by a line break.

- **change** Header number and text are interchanged, without a line break.

- **changebreak** Like change, but with a line break after the header.

- **margin** The number is set in the left margin, without a line break.

- **marginbreak** Like margin, but with a line break after the header.

- **nonumberplain** Like plain, without number (e.g. for proofs).

- **nonumberbreak** Like break, without number.

- **empty** No number, no name. Only the optional argument is typeset.

2.3.5 Default Setting

If no option is given, i.e. \texttt{ntheorem.sty} is loaded by \texttt{\usepackage{ntheorem.sty}}, the following default is set up:
Thus, by only saying `\newtheorem{...}{...}`, the user gets the same layout as in standard \LaTeX.

### 2.3.6 A Standard Set of Theorems

A standard configuration of theorem sets is provided within the file \texttt{ntheorem.std}, which will be included by the option \texttt{[standard]}. It uses the \texttt{amssymb} and \texttt{latexsym} (automatically loaded) packages and defines the following sets:

- **Theorems**: Theorem, Lemma, Proposition, Corollary, Satz, Korollar,
- **Definitions**: Definition,
- **Examples**: Example, Beispiel,
- **Remarks**: Anmerkung, Bemerkung, Remark,
- **Proofs**: Proof and Beweis.

These theorem sets seem to be the most frequently used environments in English and German documents.

The layout is defined to be theoremstyle \texttt{plain}, bodyfont \texttt{\itshape}, Headerfont \texttt{\bfseries}, and endmark (theoremsymbol) \texttt{\ensuremath{\_\Box}} for all theorem-like environments\(^1\). For the definition-, remark- and example-like sets, the above setting is used, except bodyfont \texttt{\upshape}. The proof-like sets are handled a bit differently. There, the layout is defined as theoremstyle \texttt{nonumberplain}, bodyfont \texttt{\upshape}, headerfont \texttt{\scshape} and endmark \texttt{\ensuremath{\_\blacksquare}}. For a more detailed information look at \texttt{ntheorem.std} or at the code-section.

### 2.3.7 Framed and Boxed Theorems

With the advent of the \texttt{framed} package (by Donald Arseneau) in 2001, a feature that has often been asked for for \texttt{ntheorem} could be implemented: theorems that are framed, or that are put into a colored box. It requires to load the \texttt{framed} package; shaded theorems also require the \texttt{pstricks} package. Frames and colored boxes are orthogonal to the existing theoremstyles – thus, they can be combined in arbitrary ways.

A theorem type can be framed by defining it by

\begin{verbatim}
\newframedtheorem{...}{...}
\end{verbatim}

with the same parameters as usually for \texttt{\newtheorem}. Note that the use of the \texttt{framed} package also allows to have longer theorems across a page break framed.

The same ideas hold for theorems in shaded boxes. The declaration

\begin{verbatim}
\newshadedtheorem{...}{...}
\end{verbatim}

\(^1\)Note, that mathmode is ensured for the symbol.
\newshadedtheorem{...}{...}

declares a theorem environment that is shaded. By default, the background color is gray. This can be changed by defining

\shadecolor{(color)}

before declaring the theorem type. Note that later declarations of other shaded theorem types can use another shadecolor.

By default, the box is given as a \psframebox (see pstricks package) with shadecolor as linecolor and fillcolor. All these parameters can be changed by setting

\def\theoremframecommand{(any box command)}

before declaring the theorem type (for examples, the user is referred to section 4).

2.3.8 Customization and Local Settings

Since the user should not change \ntheorem.std, we've added the possibility to use an own configuration-file. If one places the file \ntheorem.cfg in the path searched by \TeX, this file is read automatically (if [standard] is not given). The usage of \ntheorem.cfg can be prevented by the [noconfig] option. Thus, just a copy of \ntheorem.std to \ntheorem.cfg must be made which then can freely be modified by the user. Note, that if a configuration-file exists, this will always be used (i.e. with option standard and an existing configuration-file, the .cfg file will be used and the .std file won’t.

2.4 Generating Theoremlists

\listtheorems Similar to the \LaTeX command \listoffigures, any theorem set defined with a \newtheorem statement may be listed at any place in your document by

\listtheorems{list}

The argument ⟨list⟩ is a comma-separated list of the theorem sets to be listed. For a theorem set ⟨name⟩, only the instances are listed which are instantiated by \begin{⟨name⟩}. Those instantiated by \begin{⟨name⟩*} are omitted (cf. \section and \section*).

For example, \listtheorems{Corollary,Lemma} leads to a list of all instances of one of the theorem sets “Corollary” or “Lemma”. Note, that the set name given to the command is the first argument which is specified by \newtheorem which is also the one to be used in \begin{theorem} ... \end{theorem}.

If \listtheorems is called for a set name which is not defined via \newtheorem, the user is informed that a list is generated, but there will be no typeset output at all.

2.4.1 Defining the List Layout

\theoremlisttype Theoremlists can be formatted in different ways. Analogous to theorem layout, there are several predefined types which can be selected by

\theoremlisttype{(type)}
The following four \textit{types} are available (for examples, the user is referred to section 4).

\textbf{all} \quad List any theorem of the specified set by number, (optional) name and pagename. This one is also the default value.

\textbf{allname} \quad Like \texttt{all}, additionally with leading theoremname.

\textbf{opt} \quad Analogous to \texttt{all}, but only the theorems which have an optional name are listed.

\textbf{optname} \quad Like \texttt{opt}, with leading theoremname.

\textbf{2.4.2 Writing Extra Stuff to the Theorem File}

Similar to \texttt{\addcontentsline} and \texttt{\addtocontents}, additional entries to theoremlists are supported. Since entries to theoremlists are a bit more intricate than entries to the lists maintained by standard \LaTeX \texttt{\addcontentsline} and \texttt{\addtocontents} cannot be used in a straightforward way\footnote{for a theorem, its number has to be stored explicitly since different theorem sets can use the same counter. Also, it is optional to reset the counter for each section.}.

\texttt{\addtheoremline} \quad Analogous to \texttt{\addcontentsline}, an extra entry for a theorem list can be made by

\begin{verbatim}
\addtheoremline\{name\}\{text\}
\end{verbatim}

where \texttt{\{name\}} is the name of a valid theorem set and \texttt{\{text\}} is the text, which should appear in the list. For example,

\begin{verbatim}
\addtheoremline\{Example\}\{Extra Entry with number\}
\end{verbatim}

generates an entry with the following characteristics:

- The Label of the theorem “Example” is used.
- The current value of the counter for “Example” is used
- The current pagename is used.
- The specified text is the optional text for the theorem.

Thus, the above command has the same effect as it would be for

\begin{verbatim}
\begin{Example}\{Extra Entry with number\}\end{Example}
\end{verbatim}

except, that there would be no output of the theorem, and the counter isn’t advanced.

\texttt{\addtheoremline*} \quad Alternatively you can use

\begin{verbatim}
\addtheoremline*\{Example\}\{Extra Entry\}
\end{verbatim}

which is the same as above, except that the entry appears without number.

\texttt{\addtotheoremline} \quad Sometimes, e.g. for long lists, special control sequences (e.g. a pagebreak) or additional text should be inserted into a list. This is done by

\begin{verbatim}
\addtotheoremline\{name\}\{text\}
\end{verbatim}

where \texttt{\{name\}} is the name of a theorem set and \texttt{\{text\}} is the text to be written into the theorem file. If the optional argument \texttt{\{name\}} is omitted, the given text is inserted in every list, otherwise it is only inserted for the given theorem set.
2.5 For Experts: Defining Layout Styles

2.5.1 Defining New Theorem Layouts

Additional layout styles for theorems can be defined by

```latex
\newtheoremstyle
\newtheoremstyle{\name}{\head}{\opthead}
```

After this, `\theoremstyle{\name}` is a valid `\theoremstyle`. Here, `\head` has
to be a statement using two arguments, `##1`, containing the keyword, and `##2`,
containing the number. `\opthead` has to be a statement using three arguments
where the additional argument `##3` contains the optional parameter.

Since \LaTeX{} implements theorem-like environments by `\trivlist`, both header
declarations must be of the form `\item[... \theoremlisttype ...]...`
where the dotted parts can be formulated by the user. If there are some state-
ments producing output after the `\item[...]`, you have to care about implicit
spaces.

Because of the `\`, if `\newtheoremstyle` is used in a `.tex` file, it has to be put
between `\makeatletter` and `\makeatother`.
For details, look at the code documentation or the definitions of the prede-
defined theoremstyles.

Theorem styles can be redefined by `\renewtheoremstyle`, with the same arguments
as explained for `\newtheoremstyle`.

2.5.2 Defining New Theorem List Layouts

Analogous, additional layouts for theorem lists can be defined by

```latex
\newtheoremlisttype{\name}{\start}{\line}{\end}
```

The first argument, `\name`, is the name of the listtype, which can the be used as
a valid `\theoremlisttype`. `\start` is the sequence of commands to be executed at
the very beginning of the list. Corresponding, `\end` will be executed at the end of
the list. These two are set to do nothing in the standard-types. `\line` is the part to
be called for every entry of the list. It has to be a statement using four arguments:
`##1` will be replaced with the name of the theorem, `##2` with the number, `##3` with
the theorem’s optional text and `##4` with the pagenumber.

WARNING: Self-defined Layouts will break with the `hyperref`-package.

Theorem list types can be redefined by `\renewtheoremlisttype`, with the same arguments
as explained for `\newtheoremlisttype`.

2.6 Setting End Marks

The automatic placement of endmarks is activated by calling `ntheorem.sty` with
the option `[thmmarks]`. Since then, the endmarks are set automatically, there are
only a few commands for dealing with very special situations.

If in a single environment, the user wants to replace the standard endmark by
some other, this can be done by saying `\qed`, if `\qedsymbol` has been defined by
`\qedsymbol{\something}` (in option standard, `\qedsymbol` is defined to be the
symbol used for proofs, since a potential use of this features is to close trivial
corollaries without explicitly proving them).
Additionally, if in a single environment of a theorem set, that is defined without an endmark, the user wants to set an endmark, this is done with \qedsymbol and \qed as described above. \qedsymbol can be redefined everywhere in the document. On the other hand, if in some situation, the user decides to set the endmark manually (e.g. inside a figure or a minipage), the automatic handling can be turned off by \NoEndMark for the current environment. Then – assumed that the current environment is of type \langle name \rangle, the endmark can manually be set by just saying \langle name \rangle Symbol.

Note that there must be no empty line in the input before the \end{theorem}, since then, the end mark is ignored (cf. Theorem 3 in Section 4).

2.7 Extended Referencing Features

The extended referencing features are activated by calling \ntheorem.sty with the option [thref].

Often, when writing a paper, one changes propositions into theorems, theorems into corollaries, lemmata into remarks an so on. Then, it is necessary to adjust also the references, i.e., from “see Proposition \ref{completeness}” to “see Theorem \ref{completeness}”. For relieving the user from this burden, the type of the respective labeled entities can be associated with the label itself:

\label{\langle label \rangle}[\langle type \rangle]

associates the type \langle type \rangle with \langle label \rangle.

This task is automated for theorem-like environments:

\begin{Theorem}[\langle name \rangle]\label{\langle label \rangle}

is equivalent to

\begin{Theorem}[\langle name \rangle]\label{\langle label \rangle}[\text{Theorem}]

The additional information is used by

\thref{\langle label \rangle}

which outputs the respective environment-type and the number, e.g., “Theorem 42”. Note that \LaTeX has to be run twice after changing labels (similar to getting references OK; in the intermediate run, warnings about undefined reference types can occur).

The [thref] option interferes with the \texttt{babel} package, thus in this case, \texttt{nttheorem} has to be loaded \textit{after} \texttt{babel}. It also interferes with \texttt{amsmath}; see Section 3.2.

2.8 Miscellaneous

Inside a theorem-like environment \langle env \rangle, the name given as optional argument is accessible by \langle env \rangle name.
3 Possible Interferences

Since \texttt{ntheorem} reimplements the handling of theorem-environments completely, it is incompatible with every package also concerning those macros. Additionally, the \texttt{thmmarks} algorithm for placing endmarks requires modifications of several environments (cf. Section 7). Thus, environments which are reimplemented or additionally defined by document options or styles are not covered by the endmark algorithm of \texttt{ntheorem.sty}.

The [\texttt{thref}] option changes the \texttt{\label} command and the treatment of labels when reading the \texttt{.aux} file. Thus it is potentially incompatible with all packages also changing \texttt{\label} (or \texttt{\newlabel}). Compatibility with babel’s \texttt{\newlabel} is achieved if babel is loaded before ntheorem.

3.1 Interfering Document Options.

\texttt{ntheorem.sty} also copes with the usual document options \texttt{leqno} and \texttt{fleqn}\footnote{although for \texttt{fleqn} and long formulas reaching to the right margin, equation numbers and endmarks can be smashed over the formula since \texttt{fleqn} does not use \texttt{\eqno} for controlling the setting of the equation number.}. If one of those options is used in the \texttt{\documentclass} declaration, it is automatically recognized by the \texttt{thmmarks} part of \texttt{ntheorem.sty}.

If one of those options is not used in \texttt{\documentclass}, but with \texttt{amsmath} (see next section), it must not be specified for \texttt{ntheorem}, since all \texttt{amsmath} environments detect this option by themselves.

3.2 Combination with amslatex.

\texttt{ntheorem.sty} interferes with \texttt{amsmath.sty} and \texttt{amsthm.sty}.

Note, that the LaTeX amstex package \texttt{amstex.sty (\LaTeX 2.09)} is obsolete and you should use \texttt{amsmath} and \texttt{amstext} for \LaTeX 2ε instead. Up to \texttt{ntheorem-1.18}, it is compatible with \texttt{amsmath-1.x}. Since \texttt{ntheorem-1.19}, it is (hopefully) compatible with \texttt{amsmath-2.x}.

We would be happy if someone knowing and using \texttt{amsmath} would join the development and maintenance of this style.

3.2.1 amsmath

Compatibility with amsmath (end marks for math environments, and handling of labels in math environments) is provided in the option [\texttt{amsmath}], (i.e., if \texttt{\usepackage[amsmath]} is used then

\begin{itemize}
  \item \texttt{\usepackage[thmmarks]{ntheorem}} must be completed to \texttt{\usepackage[amsmath,thmmarks]{ntheorem}}, and also
  \item \texttt{\usepackage[thref]{ntheorem}} must be completed to \texttt{\usepackage[amsmath,thref]{ntheorem}}.
\end{itemize}

Note, that \texttt{amsmath} has to be loaded before \texttt{ntheorem} since the definitions have to be overwritten.
3.2.2 amsthm

amsthm.sty conflicts with the definition of theorem layouts in theorem.sty, some features of amsthm.sty have been incorporated into option [amsthm] which has to be used instead of \usepackage{amsthm}.

The Option provides theoremstyles plain, definition, and remark, and a proof environment as in amsthm.sty.

The \newtheorem* command is defined even without this option. Note that \newtheorem* always switches to the nonumbered version of the current theoremstyle which thus must be defined.

The command \newtheoremsstyle is not taken over from amsthm.sty. Also, \swapnumbers is not implemented. Here, the user has to express his definitions by the \newtheoremsstyle command provided by ntheorem.sty, including the use of \theoremlheaderfont and \theorembodyfont. The options [amsthm] and [standard] are in conflict since they both define an environment proof.

Thus, we recommend not to use amsthm, since the features for defining theorem-like environments in ntheorem.sty—following theorem.sty—seem to be more intuitive and user-friendly.

3.3 Babel

The [thref] option interferes with the babel package, thus in case that babel is used, ntheorem has to be loaded after babel.

3.4 Hyperref

Since hyperref redefines the \LaTeX \contentsline-command, it breaks with ntheorem below version 1.17. Since version 1.17, the option [hyperref] makes ntheorem work with hyperref. Theoremlists will then get linked list.

WARNING: The definition and redefinition of Theorem List Layouts (see Section 2.5.2) isn’t yet working with the hyperref-package.

4 Examples

The setting is as follows.

- For Theorems:

  \begin{verbatim}
  \theoremsymbol{\ensuremath{\diamondsuit}}
  \theoremnumbering{greek}
  \newtheorem{Theorem}{Theorem}
  \end{verbatim}

- For Lemmas:

  \begin{verbatim}
  \theoremsymbol{\ensuremath{\heartsuit}}
  \theoremindent0.5cm
  \newtheorem{Lemma}{Lemma}
  \end{verbatim}
• For Corollaries:

\theoremindent0cm
\theoremsymbol{\ensuremath{\spadesuit}}
\theoremnumbering{arabic}
\newtheorem{Corollary}{Theorem}[Corollary]

• For Examples:

\theoremstyle{change}
\theorembodyfont{\upshape}
\theoremsymbol{\ensuremath{\ast}}
\theoremseparator{}
\newtheorem{Example}{Example}

• For Definitions:

\theoremstyle{plain}
\theoremsymbol{\ensuremath{\clubsuit}}
\theoremseparator{.}
\theoremprework{\bigskip\hrule}
\theorempostwork{\hrule\bigskip}
\newtheorem{Definition}{Definition}

• For Proofs (note that \theoremprework and \theorempostwork are reset – proofs do not have lines above and below):

\theoremheaderfont{\sc}\theorembodyfont{\upshape}
\theoremstyle{nonumberplain}
\theoremseparator{}
\theoremsymbol{\rule{1ex}{1ex}}
\newtheorem{Proof}{Proof}

Note, that parts of the setting are inherited. For instance, the fonts are not reset before defining “Lemma”, so the font setting of “Theorem” is used.

1 Example (Simple one) The first example is just a text. In the next examples, it is shown how an endmark is put at a displaymath, a single equation and both types of eqnarrays.

1 Theorem (Long Theorem): The examples are put into this theorem environment. The next example will not appear in the list of examples since it is written as

begin{Example*} ... \end{Example*}

2 Example (Ending with a displayed formula) Look, the endmark is really at the bottom of the line:

$$f^{(n)}(z) = \frac{n!}{2\pi i} \int_{\partial D} \frac{f(\zeta)}{\zeta - z}^{n+1} d\zeta$$

At this point, we add an additional entry without number in the Example list:

\addtheoremline*{Example}{Extra Entry}
\textbf{Lemma (Display with array)}:

Lemmata are indented and numbered with greek symbols. Also for displayed arrays of this form, it looks good:

\[
\begin{array}{l}
  a = \begin{array}{l} \text{first line} \\\n  \text{second line} \end{array} \\
\end{array}
\]

Just try to get this with the presented array structure ... without using dirty tricks, you can position the outer array either \[t\], \[c\], or \[b\], and you will not get the desired effect.

\[ a = \begin{array}{l} \text{first line} \end{array} \begin{array}{l} \text{try to put this text in the lowest line} \end{array} \]

\textbf{Lemma (Equation)}:

For equations, we decided to put the endmark after the equation number, which is vertically centered. Currently, we do not know, how to get the equation number centered and the endmark at the bottom (one has to know the internal height of the math material) ... If anyone knows, please inform us.

\[
\int_\gamma f(z) \, dz := \int_a^b f(\gamma(t))\gamma'(t) \, dt
\]

With the \texttt{break-theoremstyles}, if the environment is labeled and written as

\begin{Lemma}[Breakstyle]\label{breakstyle}\end{Lemma}

\textbf{Lemma (Breakstyle)}:

you see, there is a leading space ...

If a percent (comment) (or an explicit \texttt{\ignorespaces}) is put directly after the label, e.g.

\begin{Lemma}[Breakstyle]\label{breakstyle}%

the space disappears.

From the predefined styles, this is exactly the case for the break-styles. That’s no bug, it’s \LaTeX-immanent.

The example goes on with an \texttt{eqnarray}:

\[
f(z) = \frac{1}{2\pi i} \int_{\partial D} \frac{f(\zeta)}{\zeta - z} \, d\zeta
\]

\[= \frac{1}{2\pi} \int_0^{2\pi} f(z_0 + re^{it}) \, dt
\]
Proof (of nothing)

\[ f(z) = \frac{1}{2\pi i} \oint_{\partial D} \frac{f(\zeta)}{\zeta - z} d\zeta \]

\[ = \frac{1}{2\pi} \int_0^{2\pi} f(z_0 + re^{it}) dt \]

That’s it (the end of the Theorem).

If there are some environments in the same thm-environment, the last gets the endmark:

Definition 1 (With a list).

\[ \int_{\gamma} f(z) \, dz := \int_a^b f(\gamma(t)) \gamma'(t) \, dt \] (4)

- you’ve seen, how it works for text and
- math environments,
- and it works for lists.

2 Corollary (Q.E.D.):
And here is a trivial corollary, which is ended by $\textsf{\texttt{\textbackslash qedsymbol\{\texttt{q.e.d}\}}} \text{q.e.d}$

3 Example

\[ f^{(n)}(z) = \frac{n!}{2\pi i} \oint_{\partial D} \frac{f(\zeta)}{(\zeta - z)^{n+1}} d\zeta \]

If there is some text after an environment, the endmark is put after the text.

The next one is done by the following sequence. Note, that \texttt{\textbackslash hfill} is inserted to prevent \LaTeX{} from using its nested list management (a verbatim is also a trivlist), i.e. this causes \LaTeX{} to start the verbatim-Part in a new line.

\begin{Example}
\texttt{\textbackslash hfill}
\begin{verbatim}
And, it also works for verbatim
... when the \texttt{\textendline{verbatim}} is in the
same line as the text ends. \texttt{\textendline{verbatim}}
\end{verbatim}
\end{Example}

4 Example (Using verbatim)

And, it also works for verbatim
... when the \texttt{\textendline{verbatim}} is in the
same line as the text ends.
There must be no empty line in the input before the \end{theorem} (since then, the end mark is ignored)

\begin{Theorem}
  some text ... but no end mark
\end{Theorem}

3 Theorem:
  some text ... but no end mark

Now, there is a corollary which should appear with a different name in the list of corollaries:

\begin{Corollary*}[title in text]\label{otherlabel}
...
\end{Corollary*} \addtheoremline{Corollary}{title in list}

4 Corollary (title in text):
  let's do something weird:

It also works in the center
  environment.

5 Theorem (Quote):
  In quote environments, the text is normally indented from left and right
  by the same space. The endmark is not indented from the right margin,
  i.e., it is typeset to the right margin of the surrounding text.
  
Here is an example for turning off the endmark automatics and manual handling:

\begin{Theorem}[Manual End Mark]\label{somelabel}
a line of text with a manually set endmark \hfill\TheoremSymbol
some more text, but no automatic endmark set. \NoEndMark
\end{Theorem}

6 Theorem (Manual End Mark):
  a line of text with a manually set endmark
  some more text, but no automatic endmark set.

Also, one should note, that \hfill is inserted to set the endmark at the right margin.

5 Example (Quickie) It also works for short one's.

If you are tired of the greek numbers and the indentation for lemmata ... you can redefine it:

\theoremmode{changebreak}
\theoremmode{normalfont\bfseries}\theorembold{\slshape}
\theoremsymbol{\ensuremath{\heartsuit}}
\theoremsymbol{\ensuremath{\diamondsuit}}
4 Lemma: another lemma, with arabic numbering ... note that the numbering continues. ◊

the optional argument (i.e. the ‘theorem’-name) can be accessed by \(env\)name.

\begin{Theorem}[somename]
Obviously, we are in Theorem\~\Theoremname.
\end{Theorem}

7 Theorem (somename):
Obviously, we are in Theorem somename. ◊

This feature can e.g. be used for automatically generating executable code and a commented solution sheet:

\begin{exercise}[quicksort]
\verbatimwrite{solutions/\exercisename.c}
\verbatiminput{solutions/\exercisename.c}
\end{exercise}

This will write the C-code to a file solutions/quicksort.c and type it also on the solution sheet.

Now, we define an environment KappaTheorem which uses the same style parameters as Theorems and is numbered together with Corollaries (Theorems are also numbered with Corollaries). Note that we define a complex header text and a complex end mark.

\begin{KappaTheorem}[Corollary]{\(\kappa\)-Theorem}
That’s the first Kappa-\(\kappa\)-Theorem.
\end{KappaTheorem}

8 \(\kappa\)-Theorem (1st \(\kappa\)-Theorem):
That’s the first Kappa-\(\kappa\)-Theorem.

4.1 Extended Referencing Features
The standard \label command is extended by an optional argument which is intended to contain the “name” of the structure which is labeled, allowing more comfortable referencing; e.g., this section has been started with

\subsection*{Extended Referencing Features}
\label{sec-ExtRef}

As already stated, for theorem-like environments the optional argument is filled in automatically, i.e.,

\begin{Theorem}[Manual End Mark]\label{somelabel}
(cf. page 17) is equivalent to
\begin{Theorem}[Manual End Mark]\label{somelabel}\end{Theorem}
\thref{label} additionally outputs the contents of the optional argument which has been associated with \langle label\rangle:

This is \thref{sec-ExtRef}
A theorem end mark has been set manually in \thref{somelabel}.
A center environment has been shown in \thref{otherlabel}.
The first Kappa-Theorem has been given in \thref{kappatheorem1}.

This is Section 4.1.
A theorem end mark has been set manually in Theorem 6. A center environment has been shown in Corollary 4. The first Kappa-Theorem has been given in \kappatheorem2.

Here one must be careful that the handling of the optional argument is automated only for environments defined by \newtheorem, i.e., not for sectioning, equations, or enumerations.
Calling \thref{label} for a label which has been set without an optional argument can result in different unintended results: If \langle label\rangle is not inside a theorem-like environment, an error message is obtained, otherwise the type of the surrounding theorem-like environment is output, e.g., calling \thref{label} then results in “Theorem (number)”! Additionally, currently there is no support for multiple references such as “see Theorems 5 and 7” (this would require plural-forms for different languages and handling of \ref-lists, probably splitting into different sublists for different environments).

4.2 Framed and Shaded Theorems

Framed theorem classes are defined as follows:

\begin{theoremclass}{Theorem}
\theoremstyle{break}
\newframedtheorem{importantTheorem}[Theorem]\end{Theorem}
defines important theorems to use the same design as for theorems (except that the break header style is used except the margin header style), number them with the same counter, and put a frame around them:

An instance is created by

\begin{importantTheorem}[Important Theorem]
This is an important theorem.
\end{importantTheorem}

Theorem 9 (Important Theorem):
This is an important theorem.

\footnote{If someone is interested in programming this, please contact us; it seems to be algorithmically easy, but tedious.}
More important theorems are shaded – by default in grey:

\begin{moreImportantTheorem}
This is a more important theorem.
\end{moreImportantTheorem}

Theorem 10 (More Important Theorem):
\begin{quote}
This is a more important theorem.
\end{quote}

Even more important theorems are shaded in red:

\begin{evenMoreImportantTheorem}
This is an even more important theorem.
\end{evenMoreImportantTheorem}

Theorem 11 (Even More Important Theorem):
\begin{quote}
This is an even more important theorem.
\end{quote}

Most important theorems get a framed, blue colored box with a shadow. Here, \def\theoremframecommand is used:

\begin{MostImportantTheorem}
This is a most important theorem.
\end{MostImportantTheorem}

Theorem 12 (Most Important Theorem):
\begin{quote}
This is a most important theorem.
\end{quote}

4.3 Lists of Theorems and Friends

Note, that we put the following lists into the quote-environment to emphasize them from the surrounding text. So the lists are indented slightly at the margin. With
\addtotheoremfile{Added into all theorem lists},

in every list, an additional line of text would be inserted. But it isn’t actually done
in this documentation since we want to use different list formats.

Only for the list of Examples, this one is added:

\addtotheoremfile[Example]{Only concerning Example lists}

With

\theoremlisttype{all}
\listtheorems{Lemma},

all lemmas are listed:

| \( \alpha \) | Display with array | 15 |
| \( \beta \) | Equation | 15 |
| \( \gamma \) | Breakstyle | 15 |
| 4 | | 18 |
| 5 | | 24 |
| 6 | | 25 |

From the examples, only those are listed which have an optional name:

\theoremlisttype{opt}
\listtheorems{Example}

leads to

| 0 | Extra Entry with number | 9 |
| Extra Entry | 9 |
| 1 | Simple one | 14 |
| Extra Entry | 15 |
| 4 | Using \texttt{verbatim} | 16 |
| 5 | Quickie | 17 |

Only concerning Example lists

One should note the line \textit{Only concerning example lists}, which was added by the
\addtotheoremfile{-statement above.}

For the next list, another layout, using the \texttt{tabular}-environment, is defined:

\newtheoremlisttype{tab}\%
{\begin{tabular*}{\linewidth}{{@{}lrlr\extracolsep{\fill}}r@{}}}
{\#1##2##3##4\}
{\end{tabular*}}%

Thus, by saying

\theoremlisttype{tab}
\listtheorems{Theorem,importantTheorem,moreImportantTheorem,
\hspace{1cm}evenMoreImportantTheorem,MostImportantTheorem,Lemma},

21
theorems (of all importance levels) and lemmata are listed:

<table>
<thead>
<tr>
<th>Theorem</th>
<th>Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Long Theorem</td>
<td>14</td>
</tr>
<tr>
<td>α</td>
<td>Display with array</td>
<td>15</td>
</tr>
<tr>
<td>β</td>
<td>Equation</td>
<td>15</td>
</tr>
<tr>
<td>γ</td>
<td>Breakstyle</td>
<td>15</td>
</tr>
<tr>
<td>3</td>
<td></td>
<td>17</td>
</tr>
<tr>
<td>5</td>
<td>Quote</td>
<td>17</td>
</tr>
<tr>
<td>6</td>
<td>Manual End Mark</td>
<td>17</td>
</tr>
<tr>
<td>4</td>

<tr>
<td>9</td>
<td>Important Theorem</td>
<td>19</td>
</tr>
<tr>
<td>10</td>
<td>More Important Theorem</td>
<td>20</td>
</tr>
<tr>
<td>11</td>
<td>Even More Important Theorem</td>
<td>20</td>
</tr>
<tr>
<td>12</td>
<td>Most Important Theorem</td>
<td>20</td>
</tr>
<tr>
<td>13</td>
<td>Correctness</td>
<td>23</td>
</tr>
<tr>
<td>14</td>
<td>Completeness</td>
<td>24</td>
</tr>
<tr>
<td>5</td>
<td></td>
<td>24</td>
</tr>
<tr>
<td>6</td>
<td></td>
<td>25</td>
</tr>
<tr>
<td>15</td>
<td></td>
<td>25</td>
</tr>
</tbody>
</table>

\LaTeX-lists can also be used to format the theoremlist. The input

\begin{verbatim}
\newtheoremlisttype{list}\%
{\begin{trivlist}\item}
{\item[##2 ##1:]\ ##3\dotfill ##4}\%
{\end{trivlist}}
\theoremlisttype{list}
\listtheorems{Corollary}
\end{verbatim}

leads to

2 Corollary: Q.E.D. ................................. 16
4 Corollary: title in list .......................... 17

In this example, after the item, \ thụ is used instead of \ thụ with \dotfill will produce an error if the optional argument (##3) is missing.

5 The End Mark Algorithm

5.1 The Idea

The handling of endmarks with \texttt{thmmarks.sty} is based on the same two-pass principle as the handling of labels: the necessary information about endmarks is contained in the \texttt{.aux} file.

With \texttt{thmmarks.sty}, \LaTeX{} is always aware whether it is in some theorem-like environment. There, potential positions for endmarks can be

1. at the end of simple text lines in open text,
2. at the end of displaymatics,
3. at the end of equations or equationarrays, or
4. at the end of text lines at the end of lists (or, more general, \texttt{trivlists}, such as \texttt{verbatim} or \texttt{center}).

The problem is, that in the cases (2)–(4), the endmarks has to be placed in a box which is already shipped out, when \texttt{\end{...}} is processed. Thus, in those situations, \TeX needs to know from the .\texttt{aux} file, whether is has to put an endmark.

When \TeX is in a theorem-like environment and comes to one of the points mentioned in (2)–(4), and the .\texttt{aux} file says that there is an endmark, then it is put there. Anyway, it maintains a counter of the potential positions of an end mark in the current theorem-like environment. When it comes to an \texttt{\end{theorem}}, it looks if it is in situation (1) (then the endmark is simply put at the end of the current line). Otherwise, the last horizontal box is already shipped out (thus it contains a situation (2)–(4)) and the endmark must be set in it. In this case, a note is written in the .\texttt{aux} file, where the endmark actually has to be set (ie, at the latest potential point for setting an endmark inside the theorem).

5.2 The Realization

Let \texttt{(env)} be a theorem-like environment. Then, additional to the counter \texttt{\begin{env}ctr}, \TeX maintains two counters \texttt{\begin{env}currctr} and \texttt{\begin{env}endctr}. In the \texttt{i}th environment of type \texttt{(env)}, \texttt{\begin{env}currctr} = \texttt{i} (the \LaTeX counter \texttt{\begin{env}ctr} cannot be used since a) environments can use the counter of other environments, and b) often counters are reinitialized inside a document). \texttt{\begin{env}endctr} counts the potential situations for putting an endmark inside an environment. It is set to 1 when starting an environment. Each time, when a situation (2)–(4) is reached, the command

\begin{verbatim}
\mark<\roman{\begin{env}currctr}><\roman{\begin{env}endctr}>
\end{env}
\end{verbatim}

is called (<\texttt{\roman{\begin{env}currctr}}>\texttt{\begin{env}}>\texttt{\roman{\begin{env}endctr}}> uniquely identifies all situations (2)–(4) in a document).

If at this position an endmark has to be set,

\begin{verbatim}
\mark<\roman{\begin{env}currctr}><\roman{\begin{env}endctr}>
\end{env}
\end{verbatim}

is defined in the .\texttt{aux} file to be \texttt{\begin{env}Symbol}, otherwise it is undefined and simply ignored.

When \TeX comes to an \texttt{\end{env}}, it looks if it is in situation (1). If so, the endmark is simply put at the end of the current line. Otherwise,

\begin{verbatim}
\def\mark<\roman{\begin{env}currctr}><\roman{\begin{env}endctr}>{{\begin{env}Symbol}}
\end{verbatim}

is written to the .\texttt{aux} file for setting the endmark at the latest potential position inside the theorem in the next run.

13 Theorem (Correctness):

1. For a .\texttt{tex} file, which does not contain nested theorem-like environments of the same type, in the above situation, the following holds: When compiling, at the \texttt{i}th situation in the \texttt{j}th environment of type \texttt{(env)}, \texttt{\mark \begin{env} j \end{env} \i} is handled.

For .\texttt{tex} files which contain nested theorem-like environments of the same type, \texttt{\mark \begin{env} k \end{env} \l} is handled, where \texttt{k} is the number of the latest environment of type \texttt{(env)} which has been called at this moment, and \texttt{l} is the number of situations (2)–(4) which have occurred in environments of type \texttt{(env)} since the the \texttt{k}th \texttt{\begin{env}}.\texttt{\end{env}}.
2. When finishing an environment, either an endmark is set directly (when in a
text line) or an order to put the end symbol at the latest potential position
is written to the .aux file.

14 Theorem (Completeness):
The handling of endmarks is complete wrt. plain text, displaymath, equation,
eqnarray, eqnarray*, and all environments ended by endtrivlist, including
center and verbatim.

So, where can be bugs ?

• in the plain \TeX handling of endmarks,
• in some special situations which have not been tested yet,
• in some special environments which have not been tested yet.
• in the amsmath environments. We seldom use them, so we do not know their
pitfalls, and we ran only general test cases.

6 Problems and Questions

6.1 Known Limitations

• Since ntheorem.sty uses the .aux file for storing information about the posi-
tions of endmarks, L\TeX must be run twice for correctly setting the endmarks.

• Since ntheorem.sty uses the .aux file for storing information about lists in
the .thm file, a minimum of two runs is needed. If theorems move in any of
these runs up to five runs can be needed to generate correct lists.

• Since we need to expand the optional argument of theorems in various ways
for the lists, we decided to copy the text verbatim into the .thm file. Thus,
if you use things like \thesection etc., the list won’t show the correct text.
Therefore you shouldn’t use any command that needs to be expanded.

• In nested environments ending at the same time, only the endmark for the
inner environment is set, as the following example shows:

\begin{Lemma}
Some text.
\begin{Proof} The Proof \end{Proof}
\end{Lemma}

yields to

5 Lemma:

Some text.

\begin{proof}
The Proof
\end{proof}
You can handle this by specifying something invisible after the end of the inner theorem. Then the endmark for the outer theorem is set in the next line:

\begin{Lemma}
  \text{Some text.}
  \begin{Proof} The Proof \end{Proof}
\end{Lemma}

yields to

\noindent \textbf{6 Lemma:}
\textit{Some text.}

\textbf{Proof} The Proof

\begin{itemize}
  \item Document option \texttt{fleqn} is problematic: \texttt{fleqn} handles equations not by \texttt{$$} but by lists (check what happens for

  \begin{verbatim}
  \begin{theorem} \[ \text{displaymath} \] \end{theorem}
  \end{verbatim}

  in standard \TeX{}: The displaymath is \textit{not} set in an own line). Also, for long formulas, the equation number and the endmark are smashed into the formula at the right text margin.
  \item Naturally, \texttt{ntheorem.sty} will not work correctly in combination with other styles which change the handling of
    \begin{enumerate}
    \item theorem-like environments, or
    \item environments concerned with the handling of endmarks, e.g. \texttt{\[\ldots\]}, \texttt{eqnarray}, etc.
    \end{enumerate}
  \item \texttt{ntheorem.sty} is compatible with Frank Mittelbach’s \texttt{theorem.sty}, which is the most widespread style for setting theorems.
  \end{itemize}

It cannot be used \texttt{with theorem.sty}, but it can be used instead of it.

\section{Known “Bugs” and Problems}

\begin{itemize}
  \item Ending a theorem \textit{directly} after the text, e.g.

  \begin{verbatim}
  \begin{Theorem} text \end{Theorem}
  \end{verbatim}

  suppresses the endmark:

  \noindent \textbf{15 Theorem:}
  \textit{text}

  Therefore a space or a newline should be inserted before \texttt{\end{...}}.
  \item With \texttt{theoremstyle break}, if the linebreak would cause ugly linebreaking in the following text, it is suppressed.
\end{itemize}
6.3 Open Questions

- For equations, we decided to put the endmark after the equation number, which is vertically centered. Currently, we do not know, how to get the equation number centered and the endmark at the bottom (one has to know the internal height of the math material).

- The placement of endmarks is mainly based on a check whether \LaTeX{} is in an ordinary text line when encountering an end-of-environment. This question is partially answered by \texttt{\ifhmode}: In a text line, \LaTeX{} is always in \texttt{\hmode}. But, after an displaymath, \LaTeX{} is also in \texttt{\hmode}. Thus, additionally \texttt{\lastskip} is checked: after a displaymath, \texttt{\lastskip=0} holds. In most situations, when text has been written into a line, \texttt{\lastskip \neq 0}. But, this does not hold, if the source code is of the following form: \texttt{...text\label{bla}:} then, \texttt{\lastskip=0}. In those situations, the endmark is suppressed.

  ?? How can it be detected whether \LaTeX{} has just ended a displaymath?

- The above problem with the label: The break style enforces a linebreak by \texttt{\hfill\penalty-8000} after the \texttt{\trivlist}-item. Thus, \LaTeX{} gets back into the horizontal mode. The label places a “whatsit” somewhere ... and, it seems that the “whatsit” makes \LaTeX{} think that there is a line of text.

If someone has a solution to one of those questions, please inform us. (You can be sure to be mentioned in the Acknowledgements.)

7 Code Documentation

7.1 Documentation of the Macros

1. \texttt{\typeout{Style ‘\basename’, Version \fileversion\space <\filedate>}}
2. \texttt{\ProvidesPackage{ntheorem}\[\filedate \space \fileversion\]}
3. \texttt{\newif\if@thmmarks\@thmmarksfalse}
4. \texttt{\newif\if@thref\@threffalse}
5. \texttt{\newif\ifthm@tempif}

   \texttt{\textit{general setup.}}

7.1.1 Thmmarks-Related Stuff

1. \texttt{\DeclareOption{thmmarks}{%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%}}
2. \texttt{\PackageInfo{\basename}{Option ‘thmmarks’ loaded}\%}
3. \texttt{\%}
4. \texttt{\@thmmarkstrue}
5. \texttt{\newcounter{endNonectr}}
6. \texttt{\newcounter{currNonectr}}
7. \texttt{\newif\ifssetendmark\setendmarktrue}

   activate placement of endmarks and define counters for upper level.

\texttt{\ifssetendmark:} true if an endmark has to be set in a complex situation which must be handled by the .aux file. For further comments see \texttt{\@endtheorem}.

In the following, all relevant environments are changed for handling potential endmark positions:

\texttt{Changes to List Environment}

Original: \texttt{ltlists.dtx}
\endtrivlist Replaces \LaTeX{}'s \texttt{\endtrivlist}. An augmented functionality of \LaTeX{}'s \texttt{\endtrivlist} is contained in \texttt{\@endtrivlist}.

At an \texttt{\endtrivlist} (which is called at the end of \texttt{\list} environments and several other environments), \texttt{\@endtrivlist} is called to end the \texttt{\trivlist} and set a potential position for an endmark at the end of the line if \TeX{} is in a text line.

\texttt{\@endtrivlist} A new command\] which augments \LaTeX{}'s functionality of \texttt{\endtrivlist} by checking if an end mark has to be set:

\begin{verbatim}
\gdef\@endtrivlist#1{% % from \endtrivlist
  \if@inlabel \indent\fi
  \if@newlist \@noitemerr\fi
  \ifhmode
    \ifdim\lastskip >\z@ #1\unskip \par %<<<<<<<<<<<<<<<<<<<<<<
    \else \unskip \par \fi
  \fi
  \if@noparlist \else
    \ifdim\lastskip >\z@ 
      \@tempskipa\lastskip \vskip -\lastskip
      \advance\@tempskipa\parskip \advance\@tempskipa -\@outerparskip
      \vskip\@tempskipa
    \fi
  \fi
  \@endparenv
}\end{verbatim}

New: parameter \#1. \#1 is executed when the \texttt{\trivlist} ends with a text line (ie the endmark can be put simply at the end of the line):

Line 14: case split: if in \texttt{hmode} and \texttt{\lastskip} > 0, then \TeX{} is in a text line, the endmark is set here.

Changes to \texttt{Math Environments}
Original: \texttt{ltmath.dtx}

\endequation For equations, end marks are placed behind the equation number:

\begin{verbatim}
\gdef\SetMark@endeqn{\quad}% as default, cf. option leqno
\gdef\endequation{\eqno \hbox{\@eqnnum \PotEndMark{\SetMark@endeqn}}%$$\global\@ignoretrue} \end{verbatim}

Line 25: As default, work for equation numbers at the right: Then, a \texttt{\quad} is placed between equation number and endmark.

Line 26: In addition to the equation number (set by \texttt{\@eqnnum} at the right of the line) \texttt{\SetMark@endeqn} is carried out.

If an end mark is set, a displaymath is put into box such that the end marks appears at its bottom level at the right. Thus, also the definition of \texttt{\[} has to be changed:

\begin{verbatim}
\gdef\{% %
  \relax\ifmmode
  \@badmath
  \else
  \ifvmode
    \temskipa\lastskip \vskip -\lastskip
    \advance\temskipa\parskip \advance\temskipa -\@outerparskip
    \vskip\temskipa
  \fi
  \end{verbatim}
Lines 29–35, 43, 44: the old definition.

Lines 36–39: The end position of a displaymath inside a theorem-environment corresponds to end\InTheoType+1. An endmark has to be set there, if \mark<\roman{curr\InTheoType}>\mark+1<\roman{end\InTheoType}+1> is defined and not the empty symbol.

Lines 40–41: If so, the whole displayed stuff is put in an array with maximal depth 0.5ex and vertically adjusted with its bottom line (then, the endmarks will appear adjusted to its bottom line).

Line 42: The counter has to be re-decremented.

\[\]
\At the end of a displaymath, the end marks is set at its bottom level:
\gdef\{%\stepcounter{end\InTheoType}% \;setcounter{mark\roman{curr\InTheoType}}% \setcounter{end\Roman{curr\InTheoType}}%\relax% \setcounter{end\roman{end\Roman{curr\InTheoType}}}% \addtocounter{end\roman{end\Roman{curr\InTheoType}}}%\relax\fi\]
\addtocounter{end\InTheoType}{-1}% \%$$ BRACE MATCH HACK
\]
Line 62: As default work for equation numbers at the right: Then, the endmark is
placed below the last equation number at the right margin.

New: Lines 64, 65, 70:
Line 64: save \@eqnum.
Line 65: define \@eqnum to carry out \Oldeqnnum, then a potential endmark po-
sition is handled: if an endmark is set, between the equation number and the
demark, the command sequence \SetMark@endeqnarray is carried out – there,
since \SetMark@endeqnarray is a function of one argument, the endmark will
be this argument.

Lines 66–69: from latex.ltx. Line 66 sets the equation number.
Line 70: restore \@eqnum.

\endeqnarray* In an \eqnarray*, the end mark is set at the right of the last equation:

This is just \LaTeX’s \endeqnarray where lines 73–79 are inserted from \@@eqncr
and augmented (line 78) to set a potential endmark (with no additional commands)
at the end of the current line.

Changes to Tabbing Environment
Original: lttab.dtx

Here, the \endtrivlist modification is not sufficient: \LaTeX is not in hmode when
it calls \endtrivlist from \endtabbing; additionally, \@stopline already outputs
a linebreak. Thus, the end mark is inserted before \@stopline at the right margin
(using ‘\’).

Changes to Center Environment
Original: ltmiscen.dtx
In \TeX, \texttt{\endcenter} just calls \texttt{\endtrivlist}. Here, the situation is more complex since the endmark has to be put in the last line without affecting its centering: if in a text line (only then, here is a potential endmark position):

```
87 \gdef\endcenter{
88 \endtrivlist
89 {\PotEndMark{\mathrightskip0pt%
90 \settowidth{\mathleftskip}{\csname mark\roman{curr\InTheoType ctr}\InTheoType
91 \roman{end\InTheoType ctr}\endcsname}%
92 \advance\mathleftskip\math@flushglue\hskip\math@flushglue}}}
```

The \texttt{\rightskip} of the line is set to 0, \texttt{\leftskip} is set to the width of one space (since on the right, one space is added after the text) plus the endmark and infinitely stretchable glue (\texttt{\@flushglue}), and also the line is continued with \texttt{\@flushglue} (the actual position is one space after the text), and then the endmark is placed (by \texttt{\PotEndMark}).

**Handling of Endmarks**

\texttt{\@endtheorem-thmmarks} \texttt{\@endtheorem} is called for every \texttt{\end{env}}, where \texttt{\env} is a theorem-like environment. \texttt{\@endtheorem} is extended to organize the placement of the corresponding end mark (\texttt{\InTheoType} gives the innermost theorem-like environment, i.e. the one to be ended):

```
94 \gdef\empty{}
95 \gdef\endtheorem{
96 \expandafter\ifx\csname\InTheoType Symbol\endcsname\empty\setendmarkfalse\fi
97 \@endtrivlist
98 \ifsetendmark
99 \unskip\nobreak\hfill\nobreak\csname\InTheoType Symbol\endcsname
100 \setendmarkfalse \fi}%
102 \ifsetendmark\OrganizeTheoremSymbol\else\global\setendmarktrue\fi
103 \csname\InTheoType @postwork\endcsname
104 }
```

Lines 96, 97: if the end symbol of the environment \texttt{\env} to be closed is empty, simply no end symbol has to be set (it makes a difference, if no end symbol is set, or if an empty end symbol is set).

Lines 98, 102: (originally, it calls \texttt{\endtrivlist}):

Lines 98, 100, 101: \texttt{\@endtrivlist} is called to put \texttt{\env\Symbol} at the end of the line and set \texttt{\setendmark} to false if \TeX{} is in a text line and \texttt{\setendmark} is true. At this point, \texttt{\setendmark} is false iff the user has disabled it locally or the end symbol is empty.

Line 99: the endmark is not set, if \texttt{\setendmark} is false.

Line 102: if \texttt{\setendmark} is true, the correct placement of the end symbol is organized, else (ie either \texttt{\setendmarkfalse} is set by the user, or the endmark is already set by \texttt{\@endtrivlist} reset \texttt{\setendmark} to true.

For further comments see \texttt{\@endtrivlist} and \texttt{\OrganizeTheoremSymbol}.

The construction in line 100 guarantees that the endmark is put at the end of the line, even if it is the only letter in this line.
\NoEndMark

By \NoEndMark, the automatical setting of an end mark is blocked for the current environment.

105 \gdef\NoEndMark{\global\setendmarkfalse}

set \setendmark to false. It is automatically reset to \texttt{true} after the end of the current environment.

\qed

With \qed, the user can locally change the end symbol to appear:

106 \gdef\qed\expandafter{\def\csname InTheoType Symbol\endcsname}{\the\qedsymbol}\

When calling \qed, the end symbol of the innermost theorem-like environment at that time is set to the value stored in \qedsymbol at that time.

\PotEndMark

Handling a potential endmark position:

108 \gdef\PotEndMark#1{\SetEndMark{\InTheoType}{#1}}\

Argument: \texttt{cmd_seq} := \#1 is a command sequence to be executed when setting the endmark.

It adds the current theorem type \texttt{env} to the parameters, and calls \PotEndMark{\texttt{env}}{\texttt{cmd_seq}}.

\SetEndMark

\SetEndMark sets an endmark for an environment. It is called by \PotEndMark.

109 \gdef\SetEndMark#1#2{\stepcounter{end#1ctr}\
110 \@ifundefined{mark\roman{curr#1ctr}#1\roman{end#1ctr}}{\relax}{\mark\roman{curr#1ctr}#1\roman{end#1ctr}}\expandafter{\csname mark\roman{curr#1ctr}#1\roman{end#1ctr}\endcsname}\
111 \ifdim\rightmargin>\z@\hskip-\rightmargin\fi\
112 \hbox to 0cm{}}\

Arguments:

\texttt{env} := \#1: current theorem-environment.

\texttt{cmd_seq} := \#2: is a command sequence to be executed when setting the endmark.

Both arguments are transmitted from by \PotEndMark.

Line 110: increments \texttt{end(env)ctr} for preparing the next situation for setting a potential endmark.

Line 111, 112: if

\texttt{mark} \\\n113 \roman{curr(env)ctr}\texttt{>env} \\\n114 \roman{end(env)ctr}>

is undefined – which is the case iff at this position no endmark has to be set –, nothing is done,

Line 113: otherwise, \texttt{cmd_seq} and then

\texttt{mark} \\\n116 \roman{curr(env)ctr}\texttt{>env} \\\n117 \roman{end(env)ctr}>,

which is defined in the \texttt{.aux} file to be the end symbol are called.

The construction \texttt{cmd_seq}{\ldots} in line 113 allows the handling of the end symbol as an argument of \texttt{cmd_seq} as needed for \texttt{endeqnarray}.
Line 114: By $\hskip-\rightmargin\hbox to 0cm{}$, a negative hspace of amount $\rightmargin$ is added after the end symbol – thus, the symbol is set as there were no right margin (this concerns, e.g., \quote environments).
(applied only if $\rightmargin$ is more than 0 – otherwise bug if preceding line ends with hyphenation.)

Writing to .aux file. (copied from $\def\label$ ltxref.dtx))

Writing to .aux file. (copied from $\def\label$ ltxref.dtx))

Line 117−119 and 120−122 are similar to $\@bsphack$ and $\@esphack$ of latex.ltx.
They undo resp. redo the last skip.
Note that $\@bsphack$ and $\@esphack$ are also part of the thref option. Change both if you change them.

\OrganizeTheoremSymbol The information for setting the end marks is written to the .aux file:

\OrganizeTheoremSymbol

The information for setting the end marks is written to the .aux file:

\OrganizeTheoremSymbol

Lines 128−130: Write $\global\def\mark<\roman{curr\{env\}ctr}>\ <\roman{end\{env\}ctr}>\ {$<\{env\}Symbol}$ to the .aux file.
$\{env\}:=\{InTheoType}$ gives the innermost theorem-like environment, i.e. the one the end symbol has to be set for.

7.1.2 Option leqno to Thmmarks

7.1.2 Option leqno to Thmmarks

leqno is only active if thmmarks is also active.

Line 137, 138: Since with leqno, the equation number is placed on the left, after infinitely stretchable glue, the endmark can be set straight at the right margin.
7.1.3 Option fleqn to thmmarks

\DeclareOption{fleqn}{%  
\if@thmmarks
\PackageInfo{\basename}{Option `fleqn' loaded}%
\else
\renewcommand{\[}{%  
\ifmmode\@badmath
\else
\begin{trivlist}%

\relax\ifmmode
\egroup \PotEndMark{\} \%$  
\egroup
\end{trivlist}%
\else \@badmath\fi}
\end{equation}

Lines 143–151, 159: the old definition.
Line 152–158: if an endmark has to be set in this displaymath, it is put into an array with depth ≤ 0.5ex, and vertically adjusted to the bottom line. Here, the end mark is placed after a $\hfil$ at the end of the line containing the displaymath:

\renewcommand{\{}{%  
\stepcounter{end\InTheoType ctr}%
\@ifundefined{mark\roman{curr\InTheoType ctr}-%
\InTheoType\roman{end\InTheoType ctr}}{\relax}%
{\ifx\csname\InTheoType Symbol\endcsname\@empty\else
\addtocounter{end\InTheoType ctr}{-1}%
\relax\ifmmode
\egroup \PotEndMark{\} \%$  
\egroup
\end{trivlist}%
\else \@badmath\fi}
\end{equation}

Lines 161–165: Look, if an endmark has to be set in this displaymath. If so, close the inner array. Lines 167–172: the old definition. Line 168: Added $\PotEndMark{\} \%$

\endequation for equations, the end mark is also set with the equation number:

\def\endequation{%  
$\hfil \%$
}  
33
When the equation number is set, also the endmark is set with the same trick as for `endequation' without `fleqn'.

\endeqnarray When the equation number is set, also the endmark is set with the same trick as for `endeqnarray' without `fleqn' (see Lines 179, 180, 185):

\gdef\endeqnarray{%  
\global\let\Oldeqnnum=\@eqnnum
\gdef\@eqnnum{\Oldeqnnum\PotEndMark{\SetMark@endeqnarray}}%
\@@eqncr
\egroup
\global\advance\c@equation\m@ne $$%$$
\global\@ignoretrue
\global\let\@eqnnum\Oldeqnnum}
\fi}

7.1.4 Extended Referencing Facilities

\DeclareOption{thref}{%**********************************************
\PackageInfo{\basename}{Option `thref' loaded}%
\@threftrue
Option "thref" needs a special handling when combined with amsmath. This is also a reason why it is handled first.

\bbsphack(2)
\newskip\mysavskip
\gdef\@bbsphack{%  
\ifvmode\else\mysavskip\lastskip
\unskip\fi}
\gdef\@eesphack{%  
\ifdim\mysavskip>\z@\vskip\mysavskip \else\fi}

Note that \@bbsphack and \@eesphack are also part of the thmmarks option. Change both if you change them.

\label The original \label macro is extended (cf. ltxref.dtx) with an optional argument, containing the type of the labeled construct:

\def\label#1{%  
\@ifnextchar[%\]{\label@optarg{#1}}%
\thm@makelabel{#1}}
\def\thm@makelabel#1{%  
\@bbsphack
\edef\thm@tmp{\expandafter\expandafter\expandafter\thm@meaning
\expandafter\meaning\csnameInTheoType Keyword\endcsname\relax}%
\protected@write\@auxout{}{\string\newlabel{#1}{{\@currentlabel}{\thepage}}\thm@tmp}%
\@eesphack}
\def\label@optarg#1[#2]{% \@bsphack \protected@write@auxout{}{% \string\newlabel{#1}{{\@currentlabel}{\thepage}}[#2]}\@esphack}

thm@makelabel: If no optional argument is given, the keyword of the current environment type is used instead.

label@optarg: The original definition, extended with the optional argument which is appended to the \newlabel-command to be written to the .aux-file.

\newlabel The original behavior of \newlabel (called when evaluating the .aux-file) is also adapted.

Original syntax: \newlabel{(label)}{{(section)}{(page)}}

Modified syntax: \newlabel{(label)}{{(section)}{(page)}}{(type)}

Definition of \newlabel: \def\newlabel{\@newlabel r}.

Therefore, the modification is encoded into the \@newlabel macro:

\def\@newlabel#1#2#3{% \@ifpackageloaded{babel}{\@safe@activestrue}\relax% \@ifundefined{#1@#2}% {\gdef \@multiplelabels {\@latex@warning@no@line{There were multiply-defined labels}}}% \@latex@warning@no@line{Label `#2' multiply defined}% \global\@namedef{#1@#2}{#3}\global\@namedef{#1@#2@type}{#3}}

the macro is called with three arguments (same as originally):

#1=r, \langle labelname \rangle := #2 is the label name,

#3 is a pair (section, page-number) consisting of the values needed for \ref and \pageref, respectively.

Line 217: adaptation to babel

Lines 218–223: The original definition (both standard \LaTeX{} and babel).

Line 224: if an optional argument follows (containing the environment-type), continue with \set@label@type, otherwise return (the original behavior).

Lines 226,227: set \r@{\langle labelname \rangle}@type to the type of the respective environment.

\testdef A problem occurred, when about 250 labels to theorem-like environments have been defined: after the end of a document, the .aux file is read once more (to check if references changed). Here, \LaTeX{} redefine \@newlabel into \@testdef – and \LaTeX{} does not know that ntheorem’s \label has an additional optional argument. Thus, the argument values are not processed, but are output as normal text. Normally, this did not matter since output has already been finished by a \clearpage in \end{document}. For so many labels, a page gets filled and the output routine is called.

228 \newcommand\org@testdef{}
\let\org@testdef\@testdef
\def\@testdef#1#2#3{%
\org@testdef{#1}{#2}{#3}%
\@ifnextchar[{{@gobbleopt}{}%
}
\newcommand\@gobbleopt{}
\long\def\@gobbleopt[#1]{%

Line 231: process the optional argument.

\thref \thref is an adaptation of \ref:
\def\thref#1{%
\expandafter\ifx\csname r@#1@type\endcsname\None
\PackageWarning{\basename}{thref: Reference Type of `#1' on page}
\the@page\space undefined}\@refundefinedtrue
\else\csname r@#1@type\endcsname\textendash\fi%
\expandafter\@setref\csname r@#1\endcsname\@firstoftwo{#1}%

Lines 236,241: similar to \ref.

Line 217: if a legal theorem type is given, then output \ref{(labelname)@type}
and avoid linebreaking between the type and the number.

\% end of option thref *****************************************************************

7.1.5 Option amsmath to Thmmarks

Most of the commands are extensions of commands in amsmath.sty.
\DeclareOption{amsmath}{% ***************************************************
\if@thref
\PackageInfo{\basename}{option `amsmath' handling for `thref' loaded}%
\let\ltx@label\label
keep the handling of \label... (the one defined above in the thref option).
amsmath implements a special handling of \label inside of displaymath environments. It is extended to process the optional argument provided by the thref option:
\global\let\thm@df@label@optarg\@empty
\def\label@in@display#1{%
\ifx\df@label\@empty\else
@amsmath@err{Multiple \string\label's: label \df@label will be lost}\@eha
\fi
\gdef\df@label{#1}%
\@ifnextchar[{	hm@label@in@display@optarg}{	hm@label@in@display@noarg}%
}
\def\thm@label@in@display@noarg{%
\global\let\thm@df@label@optarg\@empty
}
\def\thm@label@in@display@optarg[#1]{%
\gdef\thm@df@label@optarg{#1}%
}

ams-thref

\let\ltx@label\label
keep the handling of \label ... (the one defined above in the thref option).
amsmath implements a special handling of \label inside of displaymath environments. It is extended to process the optional argument provided by the thref option:
\global\let\thm@df@label@optarg\@empty
\def\label@in@display#1{%
\ifx\df@label\@empty\else
\@amsmath@err{Multiple \string\label's: label \df@label will be lost}\@eha
\fi
\gdef\df@label{#1}%
\@ifnextchar[{	hm@label@in@display@optarg}{	hm@label@in@display@noarg}%
}
\def\thm@label@in@display@noarg{%
\global\let\thm@df@label@optarg\@empty
}
\def\thm@label@in@display@optarg[#1]{%
\gdef\thm@df@label@optarg{#1}%
}
The contents of \texttt{\textbackslash df@label} is handled when the equation is finished. (Currently) this happens in three macros. The modification consists of the check if \texttt{\textbackslash thm@df@label@optarg} is non-empty (i.e., holds the optional argument), and to handle it.

```latex
\def\endmathdisplay@a{% 
  \if@eqnsw \global\let\df@tag\@empty \else \ifx\df@tag\@empty \else \veqno \alt@tag \df@tag \fi \fi
  \if\textbackslash df@label\@empty \else 
    \ifx\thm@df@label@optarg\@empty \else \ltx@label\texttt{\textbackslash df@label}\fi
  \fi
  \ifnum\textbackslash dspbrk@lvl>\m@ne 
    \postdisplaypenalty -\@getpen\textbackslash dspbrk@lvl 
  \else \global\textbackslash df@label\@empty \fi
}\endmathdisplay@fleqn{% 
  $\hfil\hskip\mathmargin\egroup$
}\global\textbackslash df@label\@empty \else 
  \setbox4\hbox{\df@tag \ifx\thm@df@label@optarg\@empty \else \ltx@label\texttt{\textbackslash df@label}\fi}
}\csname emdf@\endcsname
% end of option amsmath/thref ******************************************
```

% end of option amsmath/thref
A temporarily used register.

\TagsPlusEndmarks  Since \texttt{amsmath} uses "tags" for setting end marks, some macros are defined which prepare tags which include endmarks:

\begin{verbatim}
\def\TagsPlusEndmarks{\global\let\Old@maketag@@@=\maketag@@@
\global\let\Old@df@tag=\df@tag
\iffalse\SetTagPlusEndMark
\else\iftag@\SetTagPlusEndMark\else\SetOnlyEndMark\fi\fi}
\end{verbatim}

Lines 315, 316: store the original macros.

Line 317: if equation numbers are set as default, call \texttt{\SetTagPlusEndMark} to set tag and end mark.

Line 318: if a tag is set manually, call \texttt{\SetTagPlusEndMark} to set tag and end mark.

Line 319: otherwise, call \texttt{\SetOnlyEndMark} to set only an end mark.

\SetOnlyEndMark  Set only an end mark:

\begin{verbatim}
\def\SetOnlyEndMark{\global\tag@true
\iftagsleft@
\def\df@tag{\hbox{to \displaywidth\hss\PotEndMark{\maketag@@@}}}%
\else
\def\df@tag{\PotEndMark{\maketag@@@}}%
\fi}
\end{verbatim}

Line 324: force setting the end mark as a tag:

Lines 326,327: if tags are set to the left, the tag consists of a \texttt{\hbox} over the whole displaywidth, with the (potential) endmark at its right.

Line 329: if tags are set to the right, the tag consists only of the (potential) endmark.

\SetTagsPlusEndMark  Set a tag \textit{and} an end mark:

\begin{verbatim}
\def\SetTagsPlusEndMark{\iffalse\def\maketag@@@##1{\hbox to \displaywidth{\hss\PotEndMark{\maketag@@@}}}%
\else\def\maketag@@@##1{\hbox{\PotEndMark{\maketag@@@}}}%
\fi}
\end{verbatim}

Lines 332–339: redefine the \texttt{\maketag@@@} macro:
Lines 333–335: if tags are set to the left, build a box of the whole displaywidth and put the original tag on the left, and the (potential) endmark at the right.

Lines 337,338: if the tags are set to the right, the (potential) end mark is put below it.

\RestoreTags
\gdef\RestoreTags{\global\let\maketag@@@=\Old@maketag@@@\
\global\let\df@tag=\Old@df@tag}

Lines 341,342: restore the original macros.

\endgather In the gather environment, just the augmented tag is used:
\gdef\endgather{\TagsPlusEndmarks \math@cr \black@	otwidth@ \egroup
$$\RestoreTags \ignorespacesafterend} %
\expandafter\let\csname endgather\endcsname\endgather

New:
Line 344: the last tag contains the potential endmark.
Line 349: restore the original macros.

Line 352: Since let always takes the expansion of a macro when the let is executed, all let’s have to be adjusted (this is the same for all subsequent let-statements).

\endalign \endalign also uses the augmented tags:
\def\endalign{\ifingather@\else \TagsPlusEndmarks \math@cr \black@	otwidth@ \egroup
\fi
\RestoreTags \ignorespacesafterend}

New:
Lines 354, 355: if the align is not inside another environment, its tags have to contain the endmarks.

Line 366: this case, the original macros have to be restored.
The \texttt{multline} environment has two different \texttt{end} commands, depending if the equation numbers are set on the left or on the right:

\begin{verbatim}
\def\lendmultline@{\%\global\@eqnswfalse\tag@false\tagsleft@false\endmultline@}
\end{verbatim}

End of \texttt{multline} environment if tags are set to the left: in this case, the last line of a \texttt{multline} does not contain a tag. Thus the situation of setting an endmark tag at the right is faked:

Lines 378, 379: display no equation number, don’t set an equation tag (but use the tag mechanism for the end mark - see \texttt{\TagsPlusEndmarks} and \texttt{\SetOnlyEndMark}), set it at the right, and call \texttt{\rendmultline}.

\begin{verbatim}
\def\rendmultline@{\TagsPlusEndmarks % \IfTag\%\let\endmultline@math\relax\IfShiftTag\%\hskip\multlinegap\llap{\vtop{\raise@tag\normalbaselines\setbox\@ne\null\dp\@ne\lineht@\box\@ne\hbox{\strut@\make@display@tag}}}%\else\hskip\multlinetaggap\make@display@tag\fi}{\else\hskip\multlinegap\hfilneg\math@cr\egroup\ RestoreTags} % \end{verbatim}

New:
Line 381: last tag contains the potential endmark.
Line 405: restore the original macros
\endmathdisplay

\def\endmathdisplay#1{%
  \ifmmode \else \@badmath \fi
  \TagsPlusEndmarks
  \endmathdisplay@a
  $\%$
  \RestoreTags
  \global\let\df@label\@empty
  \global\let\df@tag\@empty
  \global\tag@false
  \global\let\alt@tag\@empty
  \global\@eqnswfalse
}%

Added Line 408: set potential end mark at bottom niveau of displaymath.

7.1.6 Theorem-Layout Stuff

\let\thm@usestd\@undefined
\DeclareOption{standard}{\let\thm@usestd\relax}
\let\thm@noconfig\@undefined
\DeclareOption{noconfig}{\let\thm@noconfig\relax}

Options for selection of a configuration: if no such option is given ntheorem.cfg
will be loaded (which has to be provided by the user), \texttt{[standard]} will load
ntheorem.std, a predefined setting, and \texttt{[noconfig]} does not preload any config-
uration.

\gdef\InTheoType{None}
\gdef\NoneKeyword{None}
\gdef\NoneSymbol{None}
\gdef\None{None}

Set \InTheoType to \texttt{none} on the upper document level.
With \newtheoremstyle, new theorem-layout styles are defined.

\gdef\newtheoremstyle#1#2#3{% 
  \expandafter\ifundeefined{th@#1}% 
  \{\expandafter\gdef\csname th@#1\endcsname{ 
    \def\@begintheorem####1####2{#2} 
    \def\@opargbegintheorem####1####2####3{#3}}}% 
  \{\PackageError{\basename}{Theorem style #1 already defined}@@ha}%
Arguments:
\langle style\rangle:=#1: the name of the theoremstyle to be defined,
\langle cmd_seq\rangle:=#2: command sequence for setting the header for environment instances with no optional text,
\langle cmd_seq\rangle:=#3: command sequence for setting the header for environment instances with optional text.
Line 443: if this style is not yet defined, define it.
Line 444: define \texttt{th@style} to be a macro which defines
Line 445: a) the two-argument macro \texttt{\@begintheorem#1#2} to be \langle cmd_seq\rangle,
Line 446: b) \texttt{\@opargbegintheorem#1#2#3} to be \langle cmd_seq\rangle.

The predefined theorem styles use this command.

\gdef\renewtheoremstyle#1#2#3{% 
  \expandafter\ifundeefined{th@#1}% 
  \PackageError{\basename}{Theorem style #1 undefined}\@ehc}% 
  {}% 
  \expandafter\let\csname th@#1\endcsname\relax
  \newtheoremstyle{#1}{#2}{#3}
Arguments:
\langle style\rangle:=#1: the name of the theoremstyle to be defined,
#2, #3 as for \texttt{newtheoremstyle}.
Checks, if theoremstyle \langle style\rangle is already defined. If so, \texttt{th@\langle style\rangle} is made unde-
defined and \texttt{newtheoremstyle} is called with the same arguments.

Predefined Theorem Styles

\texttt{th@plain, th@change, and th@margin} taken from theorem.sty by Frank Mittelbach;
the break-styles have been changed.
\gdef\newtheoremstyle{plain}{% 
  \hskip\labelsep \textbf{##1} \ ##2\textbf{##3}}% 
  \hskip\labelsep \textbf{##1} \ ##2\textbf{##3}}% 
  \newtheoremstyle{break}{% 
  \rlap{\vbox{\hbox{##1} \ ##2\textbf{##3}}}}% 
  \rlap{\vbox{\hbox{##1} \ ##2\textbf{##3}}}}% 
  \newtheoremstyle{change}{% 
  \hskip\labelsep \textbf{##2} \ ##1\textbf{##3}}% 
  \hskip\labelsep \textbf{##2} \ ##1\textbf{##3}}%
For instance, \texttt{break} is commented:
\texttt{\theorembreak} results in
\begin{verbatim}
\gdef\th@break{%
  \def\@begintheorem##1##2{%
    \item[##1] \hfill\penalty-8000}%
\end{verbatim}
Then, calling \th@break sets \@begintheorem as follows:
Since each theorem environment is basically a trivlist, the header is set as the item contents: \theorem@headerfont holds the font commands for the header font, ##1 is the keyword to be displayed, and ##2 its environment number. The linebreak after the header is achieved by offering to fill the line with space and the distinct wish to put a linebreak after it. Thus, if plain text follows, the line break is executed, but if a list or a display follows, it is not executed.
Note: The \hfill\penalty-8000 causes \TeX to leave vertical mode, setting the item contents (ie the header) and entering horizontal mode to perform the \hfill.

\textbf{The handling of \theoremstyle, \theorembodyfont, and \theoremskipamounts} is taken from theorem.sty by Frank Mittelbach:
\begin{verbatim}
\gdef\theoremstyle#1{% 
  \@ifundefined{th@#1}{\@warning{Unknown theoremstyle `#1'. Using `plain'}% 
     \theorem@style{plain}}% 
  \theorem@style{#1}}
\end{verbatim}
If \theoremstyle is called, it is checked if the argument is a valid \texttt{theoremstyle}, and if so, it is stored in the token \texttt{\theoremstyle}. It is initialized to \texttt{plain}.

\textbf{Theorem font and number settings}
\begin{verbatim}

\amsthm
563 \DeclareOption{amsthm}%% *********************************************
564 \PackageInfo{basename}{Option `amsthm' loaded}%%
565 \def\swapnumbers{\PackageError{basename}{\swapnumbers not implemented.}
Deﬁnes theorem styles \texttt{plain}, \texttt{definition}, and \texttt{remark}, and environment \texttt{proof} according to \texttt{amsthm.sty}.

\subsection*{7.1.7 Theorem-Environment Handling Stuff}

Original: \texttt{ltthm.dtx}

An auxiliary variable.

\textbf{Defining New Theorem-Environments.}
\newtheorem
\gdef\newtheorem{%
  \newtheorem@@i%
}

\newtheorem@@i The syntax of the original \newtheorem is retained. The macro is extended to deal with the additional requirements:
\gdef\newtheorem@@i{%
  \@ifstar
  {%\expandafter\@ifundefined{th@nonumber\the\theorem@style}{}%\PackageError{% Theorem style {nonumber\the\theorem@style} undefined (you need it here for newtheorem*) \@ehc}%
    \edef\@tempa{{nonumber\the\theorem@style}}%\expandafter\theorem@@style\@tempa\@newtheorem
  }{%\edef\@tempa{{\the\theorem@style}}%\expandafter\theorem@@style\@tempa\@newtheorem}
}

Deﬁnes \theorem@@style to be the current \theoremstyle or – in case of \newtheorem* – to be its non-numbered equivalent (which has to be deﬁned!), and then calls \@newtheorem.

\renewtheorem
\gdef\renewtheorem{%
  \@ifstar
  {%\expandafter\@ifundefined{th@nonumber\the\theorem@style}{}%\PackageError{% Theorem style {nonumber\the\theorem@style} undefined (you need it here for newtheorem*) \@ehc}%
    \edef\@tempa{{nonumber\the\theorem@style}}%\expandafter\theorem@@style\@tempa\@renewtheorem
  }{%\edef\@tempa{{\the\theorem@style}}%\expandafter\theorem@@style\@tempa\@renewtheorem}
}

Analogous to \newtheorem.

\@newtheorem \@newtheorem does the main job for initializing a new theorem environment type. It is called by \newtheorem.
\gdef\@newtheorem{i}{%\thm@tempiffalse
  \expandafter\@ifdefinable\csname i\endcsname{\expandafter\@ifdefinable\csname i*\endcsname{\thm@definelthm{i}% for lists
    \if@thmmarks
      \expandafter\@ifundefined{c@curr#1ctr}{}{\newcounter{curr#1ctr}}%
      \expandafter\@ifundefined{c@end#1ctr}{}{\newcounter{end#1ctr}}%
      \expandafter\protected@xdef\csname #1Symbol\endcsname{\the\theoremsymbol}%
      \expandafter\protected@xdef\csname #1@postwork\endcsname{\the\theorempostwork}%
      \gdef\csname i\endcsname{%
  }%
Argument: \( \text{env} \):= #1 is the (internal) environment name to be defined, which is read from the \LaTeX\ source.

Lines 636–661 are executed exactly if \( \text{env} \) and \( \text{env}^* \) are not yet defined.

Line 636: \texttt{\let\@thm@tempif=true} iff \( \text{env} \) and \( \text{env}^* \) are not yet defined.

Line 637: Initialize theorem list handling for \( \text{env} \).

Lines 639–642: if \texttt{thmmarks} is active and the counters are not yet defined, for every theorem-like, define

\begin{itemize}
  \item \texttt{curr(\text{env})ctr}: in the \textit{i}th environment of type \( \text{env} \), \texttt{curr(\text{env})ctr} = i, and
  \item \texttt{end(\text{env})ctr}: when the innermost environment is of type \( \text{env} \), in the \textit{j}th potential position for an end mark in this environment, \texttt{end(\text{env})ctr} = j. (if the counters are already defined, \( \text{env} \) is redefined, and these internal counters have to be continued).
\end{itemize}

Lines 644–661: define several commands: (\texttt{\vdef} expands the definition at the time it is called and makes it global):

Line 644: store the current value of \texttt{\theoremsymbol} (\texttt{\edef}: expand \texttt{\the\theoremsymbol} now) as \texttt{(\text{env})Symbol}.

Line 645: store the current value of \texttt{\theorempostwork} (\texttt{\edef}: expand \texttt{\the\theorempostwork} now) as \texttt{(\text{env})Postwork}.

48
Defining commands \env and \env* to set the header of \env. (using a switch \thm@starredenv: \relax iff starred).

Set \end(env)* to \end(env).

define \setparms@(env) to set the style parameters of the header for every (env) environment (in the sequel, current means, at the moment \@newtheorem is called):

setting \theorem@headerfont to the current value of \theoremboldfont, followed by a check if it is a bold style,

setting \theorem@separator to the current value of \theoremboldfont,

setting \theorem@prework to the current value of \theoremboldfont,

setting \theorem@indent to the current value of \theoremboldfont,

executing the command sequence currently stored in \theoremboldfont, and

calling \th@\the\theorem@style (which initializes \@begintheorem and \@opargbegintheorem according to the current value of \theoremstyle by calling \th@\the\theorem@style).

Define \th@class@ to initialize all style parameters as they are set for the (env) environment.

Note, that the \@ifdefinable from line 634 ends after line 679.

According to the next character, call \newthm{(env)} (if another counter is used) or \nthm{(env)}.

Thus, when calling \newthm with #1=env, for current values \theoremstyle=plain, \theoremboldfont=upshape, \theoremboldfont=bf, \theoremboldfont=;,
\theoremboldfont=1cm, \theoremboldfont=arabic, and \theoremboldfont=Box, the macro \setparms@ is defined as

```
\setparms@ == \def\theorem@headerfont{\bf\checkbold}
  \def\theorem@separator{;}
  \def\theorem@indent{0cm}
  \upshape
  \th@plain
```

and the macro \th@class@ is defined as

```
\th@class@ == \def\theoremstyle{plain}
  \def\theoremboldfont{\bf}
  \def\theoremboldfont{upshape}
  \def\theoremboldfont{;}\def\theoremboldfont{0cm}
  \def\theoremboldfont{arabic}
  \def\theoremboldfont{Box}
```

Note, that line 663 must not be inside any \if...\fi construct.
\texttt{\gdef\newtheorem}{\let\c@#1\endcsname\relax\let\c@#1*\endcsname\relax\newtheorem{#1}}}

Argument: \texttt{\newtheoremin{env}}=\#1 is the (internal) environment name to be redefined, which is read from the \LaTeX{} source.

If \texttt{\newtheoremin{env}} is already defined, make it (and \texttt{\newtheoremin{env}}*, too) undefined and call \texttt{\newtheoremin{env}}.

\texttt{\newtheoremin{env}} is called by \texttt{\newtheorem} if the environment to be defined has a counter of its own.

\texttt{\gdef\newtheoremin{env}}\texttt{\newtheoremin{env}}\texttt{\newtheoremin{env}}\texttt{\newtheoremin{env}}\texttt{\newtheoremin{env}} is called by \texttt{\newtheorem} if the environment to be defined uses another counter.

\texttt{\gdef\newtheoremin{(env)}\texttt{\newtheoremin{env}}} is called by \texttt{\newtheorem} if the environment to be defined should be numbered relative to some structuring level or \texttt{\newtheoremin{env}}*.

\texttt{\gdef\newtheoremin{(env)}\texttt{\newtheoremin{env}}} is called by \texttt{\newtheorem} if the environment to be defined has a counter of its own.

\texttt{\gdef\newtheoremin{(env)}\texttt{\newtheoremin{env}}} is called by \texttt{\newtheorem} if the environment to be defined uses another counter.

\texttt{\gdef\newtheoremin{(env)}\texttt{\newtheoremin{env}}} is called by \texttt{\newtheorem} if the environment to be defined should be numbered relative to some structuring level or \texttt{\newtheoremin{env}}*.
\@thm{#1}{#2}{#3}\%  
\global\@namedef{end#1}{\@endtheorem}\fi}

Arguments:
\langle env\rangle:=#1 is the (internal) environment name to be defined (transmitted from \@newtheorem).
\langle use\_ctr\rangle:=#2 is the internal name of the theorem which counter is used, and
\langle output\_name\rangle:=#3 is its “name” to be used in the output (both read from the \TeX source).

Line 697: if the counter to be used is undefined, goto error, else set \the{env} to use \the{use\_ctr} and do the following:

Lines 699–707 happen only if \langle env\rangle is not yet defined or gets redefined:

Line 699: (from latex.ltx) make \langle env\rangle use the counter \langle use\_ctr\rangle.

Lines 700–706 similar to lines 688–694 of \@nthm.

Lines 707–709 define \mkheader@{\langle env\rangle} to set the style parameters of the header and set the header (by \@thm):

\mkheader@{\langle env\rangle} == \setparms@{\langle env\rangle}\@thm{\langle use\_ctr\rangle}\{\langle output\_name\rangle\}.

(\setparms@{\langle env\rangle} is defined when \newtheorem{\langle env\rangle} is carried out).

Line 710: (from latex.ltx): \end{\langle env\rangle} calls \end{theorem}.

\@xnthm \@xnthm is called by \@nthm if the numbering is relative to some structuring level.
\def\@nthm#1#2[#3]{%  
@ifthenelse{\ifnum\c@#1
\expandafter\@ifundefined{c@#1}{\@definecounter{#1}}{}%  
\@newctr{#1}[#3]%  
}\expandafter\xdef\csname the#1\endcsname{\@thmcountersep\csname the\theoremnumbering\endcsname{#1}}}%  
\expandafter\gdef\csname mkheader@#1\endcsname{\csname setparms@#1\endcsname\@thm{#1}{#1}{#2}}%  
\global\@namedef{end#1}{\@endtheorem}\fi}

Arguments:
\langle env\rangle:=#1 is the (internal) environment name to be defined (transmitted from \@newtheorem).
\langle output\_name\rangle:=#2 is its keyword to be used in the output,
\langle level\rangle:=#3 is the structuring level relative to which \langle env\rangle has to be numbered (both read from the \TeX source).

Lines 713–722 happen only if \langle env\rangle is not yet defined or gets redefined:

Lines 713,714: in not yet defined, define \langle env\rangle- counter (otherwise, \langle env\rangle is redefined).

Line 716: (from latex.ltx): define the counter for \langle env\rangle and add \langle level\rangle to its reset-triggers.

Lines 717, 718: define \the{\langle env\rangle} to be the command sequence
\the{\langle level\rangle}\@thmcountersep\{\langle numbering\rangle\}?{(\langle env\rangle)},  
where \langle numbering\rangle is the value of \the\theoremnumbering when \@xnthm (and thus, \newtheorem{\langle env\rangle}) is called.

51
Lines 719–721: define \texttt{\textbackslash mkheader@}(\texttt{env}) to set the style parameters of the header and set the header (by \texttt{\textbackslash @thm}):

\texttt{\textbackslash mkheader@}(\texttt{env}) == \texttt{\textbackslash setparms@}(\texttt{env})\texttt{\textbackslash @thm}{\{(env)\}{\{output\_name\}}.}

(\texttt{setparms@}(\texttt{env}) is defined when \texttt{\textbackslash @newtheorem}(\texttt{env}) is carried out).

Line 722: (from latex.ltx): \texttt{\textbackslash end\texttt{(env)}} calls \texttt{\textbackslash end\texttt{theorem}.}

\texttt{\textbackslash @ynthm} \texttt{\textbackslash @ynthm} is called by \texttt{\textbackslash @nthm} if the counter is not relative to any structuring level.

\texttt{\textbackslash gdef\textbackslash @ynthm#1#2{%}
723 \texttt{\textbackslash ifthm@tempif}
724 \texttt{\textbackslash expandafter\textbackslash ifundefined{c@#1}}%
725 \texttt{\textbackslash if\textbackslash definecounter{#1}}{()}%
726 \texttt{\textbackslash expandafter\textbackslash def\textbackslash csname the#1\textbackslash endcsname}
727 \texttt{\{}\texttt{noexpand}\textbackslash csname the\textbackslash theoremnumbering\textbackslash endcsname\{}\texttt{#1})\texttt{}}%
728 \texttt{\expandafter\textbackslash gdef\textbackslash csname mkheader@#1\textbackslash endcsname}
729 \texttt{\texttt{\{}\texttt{csname setparms@#1\textbackslash endcsname}}
730 \texttt{\texttt{\{}\texttt{thm#1}{\{}#1\texttt{\{#2\}}\texttt{}}%
731 \texttt{\texttt{\{}\texttt{global}\textbackslash @namedef\texttt@end\textbackslash end\{}#1\texttt{\{\textbackslash end\textbackslash theorem\}}}\texttt{\}}%
732 \texttt{\fi}

Arguments:
\texttt{(env):==#1} is the (internal) environment name to be defined (transmitted from \texttt{\textbackslash @newtheorem}).
\texttt{(output\_name):==#2} is its keyword to be used in the output.
\texttt{\textbackslash @ynthm} works analogous to \texttt{\textbackslash @ynthm}.

\textbf{Handling Instances of Theorem-Environments.}

\texttt{\textbackslash @thm} \texttt{\textbackslash @thm} is called by \texttt{\textbackslash @thm}(\texttt{env}) (which is defined by \texttt{\textbackslash @thm}/\texttt{\textbackslash @nthm}/\texttt{\textbackslash @ynthm}).

\texttt{\textbackslash gdef\textbackslash @thm#1#2#3{%}
733 \texttt{\textbackslash if\textbackslash thmmarks}
734 \texttt{\textbackslash stepcounter\texttt{(end\textbackslash In\textbackslash Theo\textbackslash Type} \texttt{ctr})%}
735 \texttt{\textbackslash fi}
736 \texttt{\textbackslash re\textbackslash newcommand\texttt{(\textbackslash In\textbackslash Theo\textbackslash Type)}#1%}
737 \texttt{\textbackslash if\textbackslash thmmarks}
738 \texttt{\textbackslash stepcounter\texttt{(curr\textbackslant lctr)}}%
739 \texttt{\textbackslash setcounter\texttt{(end\textbackslant lctr)}\{}0\texttt{)%}
740 \texttt{\textbackslash fi}
741 \texttt{\textbackslash fi}
742 \texttt{\textbackslash ref\textbackslash stepcounter\texttt{(\#2)}%}
743 \texttt{\textbackslash theorem\textbackslash prep\textbackslash work}
744 \texttt{\textbackslash thm\textbackslash toppsep\textbackslash theorem\textbackslash post\textbackslash skip\textbackslant amount} \% cf. latex.ltx: \texttt{\textbackslash @trivlist}
745 \texttt{\textbackslash if\textbackslash mode\texttt{\{}\texttt{advance\textbackslash thm\textbackslash toppsep\textbackslash part\textbackslash toppsep\textbackslash fi}
746 \texttt{\textbackslash trivlist}
747 \texttt{\textbackslash toppsep\textbackslash theorem\textbackslash pre\textbackslash skip\textbackslant amount}
748 \texttt{\textbackslash toppsep\textbackslash thm\textbackslash toppsep} \% used by \texttt{\textbackslash endparenv}
749 \texttt{\textbackslash advance\textbackslash linewidth \textbackslash \textbackslash theorem\textbackslash indent}
750 \texttt{\textbackslash advance\textbackslash total\textbackslash left\textbackslash margin \textbackslash theorem\textbackslash indent}
751 \texttt{\textbackslash parshape \textbackslash \textbackslash one \textbackslash \textbackslash total\textbackslash left\textbackslash margin \textbackslash linewidth}
752 \texttt{\textbackslash if\textbackslant next\textbackslash char\{}\texttt{\textbackslash @ynthm#1\{\#2\}\{\#3\}}\texttt{\textbackslash @x\textbackslash thm#1\{\#2\}\{\#3\}}\texttt{\}}

Changed to three instead of two parameters (the first one is new):
\texttt{(env):==#1} (added) internal name of the theorem environment,
\texttt{(use\_ctr):==#2} internal name of the theorem which counter is used,
\(output\_name\): #3: keyword to be displayed in the output; all arguments are transmitted from \@thm\@xthm\@ythm. Lines 734–736: if thmmarks is active, the counter for the current environment \(env\) is incremented, since the last endmark in environment \(env\) is definitely not the position for its endmark (necessary for nested environments ending at the same time).

Line 737: set \InTheoType to \(env\).

Lines 738–741: if thmmarks is active, increment curr\(env\)ctr and set end\(env\)ctr to 0.

Line 742: adapted from latex.ltx: increment the corresponding counter.

Line 743: perform prework (before theorem structure is generated).

Lines 744–748: handle \theorempreskipamount and \theorempostskipamount (if in vmode, there is additional space, cf. \trivlist and \@trivlist in latex.ltx).

Lines 749–751: handle \theoremindent.

Line 752: if there is an optional argument, call \@ythm\{\(env\)\}\{\(use\_ctr\)\}\{\output\_name\}, otherwise call \@xthm\{\(env\)\}\{\(use\_ctr\)\}\{\output\_name\}.

\@xthm is called by \@thm if there is no optional text in the theorem header.

\@ythm is called by \@thm if there is an optional text in the theorem header.

\@xthm\ @xthm is called by \@thm if there is no optional text in the theorem header.

\@ythm\ @ythm is called by \@thm if there is an optional text in the theorem header.

\@opargbegintheorem\{\csname the#2\endcsname\}{#4}\fi
\ignorespaces

\@begintheorem\{#3\}{\csname the#2\endcsname}\%
\ifx\thm@starredenv\@undefined
\thm@thmcaption{#1}{\#3}{\csname the#2\endcsname}\fi
\ignorespaces

\@thm, \#4 is read from the \LaTeX{} source.

Line 759: define \(env\)name to be the optional argument.

Line 760: call
\@opargbegintheorem\{\output\_name\}\{\the\(use\_ctr\)\}\{\opt\_text\}

which outputs the header.

53
if \texttt{env} is not the starred version, call
\begin{verbatim}
\thm@thmcaption{\texttt{env}}{\{\texttt{output|name}\}}{\{\texttt{use|ctr}\}}{\{\texttt{opt|text}\}}
\end{verbatim}
which makes an entry into the theorem list.

\texttt{\end{env}} is called for every \texttt{\end{env}}, where \texttt{env} is a theorem-like environment. (note that \texttt{\end{env}} it is also changed by option \texttt{thmmarks} to organize the placement of the corresponding end mark). \texttt{\InTheoType} gives the innermost theorem-like environment, i.e. the one to be ended:

\begin{verbatim}
\gdef\@endtheorem{%  
\endtrivlist \csname\InTheoType @postwork\endcsname
\end{verbatim}

7.1.8 Framed and Boxed Theorems

The option ‘framed’ activates framed and boxed layouts. It requires to load the \texttt{framed} package and the \texttt{pstricks} package.

\begin{verbatim}
framed
\DeclareOption{framed}{%*********************************
\newtoks\shadecolor \shadecolor{gray} \let\theoremframecommand\relax
\newshadedtheorem
\def\newshadedtheorem#1{%  \expandafter\global\expandafter\xdef\csname#1@shadecolor\endcsname{%  \the\shadecolor}  \ifx\theoremframecommand\relax  \expandafter\global\expandafter\xdef\csname#1@framecommand\endcsname{%    \noexpand\psframebox[fillstyle=solid,fillcolor=\csname#1@shadecolor\endcsname,\linecolor=\csname#1@shadecolor\endcsname]{}  \else  \expandafter\global\expandafter\let\csname#1@framecommand\endcsname\theoremframecommand  \fi  \theoremprework{\def\FrameCommand{\csname#1@framecommand\endcsname}\framed}  \theorempostwork{\endframed}  \newtheorem@i{#1}}% end of option framed **********************************************
\end{verbatim}

54
7.1.9 Generation of Theorem Lists

The following macros are needed for the generation of theorem-lists. We will document it for the theorem \begin{definition}[optional], which we assume to be the first definition at all and which is placed on page 5.

\thm@thmcaption

This macro, used internally, strips of the outer brackets from the second argument and calls \thm@caption. It’s typically called like this

\thm@caption{definition}{Definition}{1}{optional}

(internal name of the environment, output keyword, running number, optional text)

\def\thm@caption#1#2{
\let\thm@tmpii\thm@tmp
\addcontentsline{thm}{#1}{\thm@t}
}

Arguments:
- \texttt{env}:=#1 is the internal environment name,
- \texttt{output name}:=#2 is its keyword to be used in the output,
- \texttt{#3} is the running number, and
- \texttt{#4} is the optional text argument in the header.

Lines 796-797: the command sequence for the output keyword is prepared by \thm@parseforwriting (which returns \thm@tmpii) and then stored in \thm@tmpii.

Line 798: the optional text is also prepared by \thm@parseforwriting.

Lines 799-800: The output is collected and written into the .aux file, which will forward it to the theorem-file.

The following two macros are just shortcuts, often needed for the output of one single line in the theorem-lists. The first one is used in unnamed lists, the second one in named. Warning: Don’t remove the leading \let, since you will get wrong \if\fi-nesting without it, if you don’t use hyperref.

\thm@thmline@noname

\def\thm@thmline@noname#1#2#3#4{% 
\@dottedtocline{-2}{0em}{2.3em}{\protect\numberline{#2}#3}{{#4}}
}

\thm@thmline@name

\def\thm@thmline@name#1#2#3#4{% 
\@dottedtocline{-2}{0em}{2.3em}{{#1} \protect\numberline{#2}#3}{{#4}}
}

\thm@thmline

This is another short one, which only discards the outer brackets from the first argument and calls \thm@thmline. It’s normally called like this:

\thm@thmline{Definition}{1}{optional}{5}

55
\longdef\thm@lgobble#1#2{\ignorespaces}

The following four macros set up the predefined list-types. To do so, they define the internal macros \thm@thmlstart (containing the code to be executed at the beginning of the list), \thm@thmlend (code to be executed at the end of the list) and \thm@thmline (code to be executed for every line). In order to gain compatibility with newthm.sty, we decided not to make these commands inaccessible to the user. But we recommend not using these commands, because they may disappear in later distributions.

\def\theoremlistall{%
  \let\thm@@thmlstart=\relax
  \let\thm@@thmlend=\relax
  \let\thm@@thmline=\thm@@thmline@noname}

\def\theoremlistallname{%
  \let\thm@@thmlstart=\relax
  \let\thm@@thmlend=\relax
  \let\thm@@thmline=\thm@@thmline@name}

\def\theoremlistoptional{%
  \let\thm@@thmlstart=\relax
  \let\thm@@thmlend=\relax
  \def\thm@@thmline##1##2##3##4{%
    \ifx\empty##3%
      \else
      \thm@@thmline@noname{##1}{##2}{##3}{##4}%
    \fi}
}

\def\theoremlistoptname{%
  \let\thm@@thmlstart=\relax
  \let\thm@@thmlend=\relax
  \def\thm@@thmline##1##2##3##4{%
    \ifx\empty##3%
      \else
      \thm@@thmline@name{##1}{##2}{##3}{##4}%
    \fi}
}

Theoremlists and Hyperref

Since the hyperref-package redefines \contentsline, we must redefine some commands to handle this:

1. Let the different versions of \thm@@thmline@.. take a 5th argument, the one provided by hyperref.
2. Don’t use hyperref’s contentsline: restore the normal definition at the beginning of `\thm@processlist` (see there).

3. Let `\thm@lgobble` take one more argument, the one provided by hyperref.

4. Do the hyperlinks manually in the different versions of `\thm@thmline` as defined by the theoremtypes.

\begin{verbatim}
\DeclareOption{hyperref}{% **********************************************
  \def\thm@@thmline@noname#1#2#3#4#5{%
    \ifx\#5\%
      \@dottedtocline{-2}{0em}{2.3em}%
      {\protect\numberline{#2}#3}%
      {#4}%
    \else
      \ifHy@linktocpage\relax\relax
        \@dottedtocline{-2}{0em}{2.3em}%
        {\protect\numberline{#2}#3}%
        {\hyper@linkstart{link}{#5}{#4}\hyper@linkend}%
      \else
        \@dottedtocline{-2}{0em}{2.3em}%
        {\hyper@linkstart{link}{#5}\
          \protect\numberline{#2}#3}%
        \hyper@linkend{#4}%
      \fi}
  \def\thm@@thmline@name#1#2#3#4#5{%
    \ifx\#5\%
      \@dottedtocline{-2}{0em}{2.3em}%
      {#1 \protect\numberline{#2}#3}%
      {#4}%
    \else
      \ifHy@linktocpage\relax\relax
        \@dottedtocline{-2}{0em}{2.3em}%
        {#1 \protect\numberline{#2}#3}%
        {\hyper@linkstart{link}{#5}{#4}\hyper@linkend}%
      \else
        \@dottedtocline{-2}{0em}{2.3em}%
        {\hyper@linkstart{link}{#5}\%
          \protect\numberline{#2}#3\hyper@linkend{#4}%
        }%
      \fi}
  \def\thm@thmline#1#2#3{	hm@@thmline#1{#2}{#3}}%
  \long\def\thm@lgobble#1#2#3{\ignorespaces}
  \let\thm@@thmlstart=\relax
  \let\thm@@thmlend=\relax
  \def\thm@thmline#1#2#3#4#5{%

      \fi}}
\end{verbatim}

57
\def\theoremlistoptname{% 
  \let\thm@thmlstart=\relax 
  \let\thm@thmlend=\relax 
  \def\thm@thmline##1##2##3##4##5{% 
    \ifx\empty##3% 
    \else% 
    \thm@thmline@name{##1}{##2}{##3}{##4}{##5}% 
    \fi} 
}% end of option hyperref

\theoremlisttype The next one is the user-interface for selecting the list-type. It simply calls \thm@thml@type, if the given \textit{type} is defined.
\def\theoremlisttype#1{% 
  \@ifundefined{thm@thml@#1}{}{% 
    \PackageError{\basename}{Listtype #1 not defined}@eha}% 
  \csname thm@thml@#1@endcsname} 

Now, here is a the code, which maps the types – selected by \theoremlisttype – to the defined macros.
\def\thm@thml@all{\theoremlistall} 
\def\thm@thml@opt{\theoremlistoptional} 
\def\thm@thml@optname{\theoremlistoptname} 
\def\thm@thml@allname{\theoremlistallname} 

\newtheoremlisttype According to the given documentation, this one can be used to define new list-types. It’s done by defining the macro \thm@thml@type, which locally redefines the commands \thm@thmlstart, \thm@thmlline and \thm@thmlend. 
\def\newtheoremlisttype#1#2#3#4{% 
  \@ifundefined{thm@thml@#1}{}{% 
    \PackageError{\basename}{List type #1 already defined}@eha}% 
  \expandafter\let\csname thm@thml@#1\endcsname\relax 
  \newtheoremlisttype{#1}{#2}{#3}{#4}} 

\renewtheoremlisttype 
\def\renewtheoremlisttype#1#2#3#4{% 
  \@ifundefined{thm@thml@#1}{}{% 
    \PackageError{\basename}{List type #1 not defined}@ehc}{} 
  \expandafter\let\csname thm@thml@#1\endcsname\relax 
  \newtheoremlisttype{#1}{#2}{#3}{#4} 
}

\thm@definelthm For each theorem-set, we need to setup two commands. Thus, the next macro is called by \newtheoremlisttype. It defines the command \l@theorem-set, which initially discard the input by calling \thm@lgobble. The first one is called for each theorem when you are generating lists. The second one is called, if you’ve added something with \addtolistfile.
\def\thm@definelthm#1{% 
  \expandafter\gdef\csname l@#1\endcsname{\thm@lgobble} 
  \expandafter\gdef\csname thm@listdo#1\endcsname{\thm@lgobble}}
\thm@inlistdo If in some case, you've written additional text into the theorem-file by \addtotheoremfile, this one is called internally. It simply discards the first argument and strips of the outer brackets from the second one.

913 \long\def\thm@inlistdo#1#2{#2}\

\listtheorems Now we need the user-interface for generating lists. This is done by the next macro. We set the \texttt{tocdepth} to \texttt{-2} to assure that the predefined list-types work. After storing the names of the theorem-sets, we call \thm@processlist, which actually generates the list.

914 \def\listtheorems#1{\begingroup
915 \c@tocdepth=-2%
916 \def\thm@list{#1}\thm@processlist
917 \endgroup}

\thm@processlist The file \texttt{(jobname).thm} contains commands of the form

\texttt{\contentsline{h theoremset\{\{\}\}{{\{\}\}{{\{}\}}}}.}

Thus, dependent on which theoremsets should be listed, \texttt{\contentsline} must be defined to evaluate the first argument and then to output all arguments, or to discard the second and third one.

This is done the following way: The commands \texttt{\l@\{theorem-set\} and \thm@listdo\{theorem-set\}} (which initially were set to ignore everything by \texttt{\newtheorem}) are redefined for the theorem sets which should be listed to generate output. \texttt{\contentsline} is defined to call \texttt{\l@\{theorem-set\}}, adding a line to the list or ignoring the entry. Since for theorem sets which are not yet known (i.e., if the list is created at the beginning of the document, and the theoremset is only defined later), \texttt{\l@\{theorem-set\}} is not yet defined, \texttt{\contentsline} has to check if the command is defined, otherwise ignore the arguments.

Then, the \texttt{.thm} file is processed, evaluating the \texttt{\contentsline} commands. After processing the theorem-file, the mentioned commands are again redefined to discard everything. We need to define the macros globally for dealing with complex, user-defined, list-types.

918 \def\thm@processlist{\%
919 \begingroup
920 \typeout{** Generating table of \thm@list}%
921 \def\contentsline##1{%
922 \expandafter\@ifundefined{l@##1}{\thm@lgobble}{\csname l@##1\endcsname}}%
923 \thm@@thmlstart
924 \@for\thm@currentlist:=\thm@list\do{%
925 \ifx\thm@currentlist\@empty\else
926 \expandafter\gdef\csname l@\thm@currentlist\endcsname{\thm@thmline}%
927 \expandafter\gdef\csname thm@listdo\thm@currentlist\endcsname{\thm@inlistdo}%
928 \fi
929 %}
930 \@input{(jobname .thm)}%
931 \thm@thmlend
932 \@for\thm@currentlist:=\thm@list\do{%
933 \ifx\thm@currentlist\@empty\else
934 \expandafter\gdef\csname l@\thm@currentlist\endcsname{\thm@inlistdo}%
935 \expandafter\gdef\csname thm@listdo\thm@currentlist\endcsname{\thm@inlistdo}%
936 \fi
937 %}
938 \endgroup}
Up to now, we’ve set up various macros for writing and reading the theorem-file. Thus, it’s time to set up the file itself. This is done by the next macro. We simply took the lines for `\@starttoc` from the \LaTeX-base and changed some things. The main intention to copy \`\@starttoc` is that we don’t want the file to be input when it is set up – like it’s done by \`\@starttoc`.

```
\def\thm@enablelistoftheorems{%
  \begingroup
  \makeatletter
  \if@filesw
    \expandafter\newwrite\csname tf@thm\endcsname
    \immediate\openout \csname tf@thm\endcsname \jobname.thm\relax
  \fi
  \@nobreakfalse
  \endgroup}
```

By `\addtheoremline`{\(\text{\{theorem-set\}}\)}{\(\text{\{entry\}}\)}, the user can insert an extra entry into the theorem-file. `\addtheoremline*` calls the internal macro `\nonumaddtheoremline`, otherwise `\numaddtheoremline` is called. `\num/nonum\addtheoremline` calls `\num/nonum\addtheoremline`{\(\text{\{theorem-set\}}\)}{\(\text{\{entry\}}\)} which are defined when \(\text{\{keyword\}}\) is declared (cf. `\@nthm`). These in turn call `\@num/nonum\addtheoremline`{\(\text{\{keyword\}}\)}{\(\text{\{entry\}}\)} which write information to the theorem file.

```
\def\addtheoremline{\@ifstar{\nonumaddtheoremline}{\numaddtheoremline}}
\def\nonumaddtheoremline#1{\csname nonumaddtheoremline#1\endcsname}
\def\numaddtheoremline#1{\csname numaddtheoremline#1\endcsname}
```

`\@nonumaddtheoremline` and `\@numaddtheoremline` write the actual entries to the .thm file.

```
\@numaddtheoremline
\def\@numaddtheoremline#1#2#3{%
  \thm@parseforwriting{#3}%
  \edef\thm@t{{#2}{\csname the#1\endcsname}{\thm@tmp}}%
  \addcontentsline{thm}{#1}{\thm@t}}%
```

To write any additional stuff into the theorem-file, the next macro is used. It first checks, if the optional name of a theorem-set is given. In that case, the macro `\@addtotheoremfile`, otherwise `\@addtotheoremfile` is used to write the stuff into the file.

```
\long\def\addtotheoremfile{%
  \@ifnextchar[{{\@addtotheoremfile}{\@addtotheoremfile}}}
```

Write additional stuff for all theorems.

```
\long\def\addtotheoremfile{%
  \thm@parseforwriting[1]%
  \protected\write@auxout
  \@string\writefile{\thm}{\thm@tmp}}
```
\@addtotheoremfile  Write additional stuff for a given theorem-set.
965 \long\def\@addtotheoremfile[#1]{% 966 \thm@parseforwriting[#2]% 967 \protected@write\@auxout{}{\string\@writefile{thm}{\string\theoremlistdo{#1}{\thm@tmp}}}}

\theoremlistdo  This one is called from the theorem-file to insert the additional stuff for a theorem-set.
969 \long\def\theoremlistdo#1#2{\expandafter\@ifundefined{thm@listdo#1}\relax{\csname thm@listdo#1\endcsname{#1}{#2}}}

Now we assure, that the theorem-file is activated. This is done by inserting a hook at the end of the document.
971 \AtEndDocument{\thm@enablelistoftheorems}

7.1.10 Auxiliary macros

For generating theorem-lists, we need to write informations into a separate file. Because we don’t want to expand this information, we parse it specially for writing.
972 \def\thm@meaning#1->#2\relax{#2}% remove "macro: ->"
973 \long\def\thm@parseforwriting#1{\def\thm@tmp{#1}\edef\thm@tmp{\expandafter\thm@meaning\meaning\thm@tmp\relax}}

In some countries it’s usual to number theorems with greek letters:

\@greek  According to \LaTeX-base, this is the internal command for generating lowercase greek numberings.
977 \def\@greek#1{\theorem@checkbold\ifcase#1\or$\alpha$\or$\beta$\or$\gamma$\or$\delta$\or$\varepsilon$\or$\zeta$\or$\eta$\or$\vartheta$\or$\iota$\or$\kappa$\or$\lambda$\or$\mu$\or$\nu$\or$\xi$\or$\omicron$\or$\varpi$\or$\varrho$\or$\varsigma$\or$\tau$\or$\upsilon$\or$\varphi$\or$\chi$\or$\psi$\or$\omega$\else\@ctrerr\fi}

\@Greek  According to \LaTeX-base, this is the user interface for lowercase greek numberings.
982 \def\@Greek#1{\@greek{\csname c@#1\endcsname}}

\greek  According to \LaTeX-base, this is the internal command for generating uppercase greek numberings.
987 \def\greek#1{\@Greek{\csname c@#1\endcsname}}
7.1.11 Other Things

After declaring several package-options, we need to process the specified ones. The additional \relax was mentioned by Rainer Schöpf at DANTE’97.

Now we set up the default theorem listtype. Make sure this is called after processing the options. Otherwise, \texttt{nttheorem} will break with \texttt{hyperref}.

If automatical configuration is not disabled by \texttt{[noconfig]}, it is checked if the file \texttt{ntheorem.cfg} exists and in this case the definitions in this file are read. If it does not exist and the option \texttt{standard} was specified, the file \texttt{ntheorem.std} is used.

\begin{verbatim}
\ifx\thm@noconfig\undefined
  \InputIfFileExists{ntheorem.cfg}{\PackageInfo{\basename}{Local config file ntheorem.cfg used}}{
    \ifx\thm@usestd\undefined
      \InputIfFileExists{ntheorem.std}{\PackageInfo{\basename}{Standard config file ntheorem.std used}}{}
    \fi}
  \fi
\end{verbatim}

7.2 The Standard Configuration

\begin{verbatim}

8 History and Acknowledgements

8.1 The endmark-Story (Wolfgang May)

In 1995, I started a hack for setting endmarks semiautomatically at the end of displayed formulas. The work on thmmarks.sty begun in October 1996 by a thread asking for a routine for setting endmarks in de.comp.tex initiated by Boris Piwinger. Version 0.1 incorporated the main features for setting endmarks automatically by using the .aux file. Version 0.2 included some bugfixes and was the first one accessible on the internet. Boris suggested to include fleqn and leqno which has been done in version 0.3 (which was never made public). Since at this point, thmmarks.sty was incompatible to the widely used theorem.sty written by Frank Mittelbach, in Version 0.4, the features of theorem.sty have been integrated. With version 0.5, the case of “empty” end symbols has been handled, \qed has been added (also suggested by Boris), and the handling of theoremstyles by \newtheoremstyle has been included. For version 0.6, the handling of endmarks in displaymaths has been changed in order to adjust them with the bottom of the displayed math. Version 0.6 was the first one announced in comp.text.tex. For version 0.7, I added the handling of amsmath features, suggested by my colleague Peter Neuhaus. Versions 0.71 and 0.72 incorporated minor bugfixes.

8.2 Lists, Lists, Lists (Andreas Schlechte)

I often saw questions on theoremlists in the german newsgroup de.comp.text.tex, but I never spent any attention on those postings. This changed in summer 1996, when I needed those lists for myself. Thus, I asked the holy question. But none of the given answers satisfied my wish for a simple, easy to use and short solution. I decided to take a look at Frank Mittelbachs theorem.sty. First I didn’t understand much of the code, but Bernd Raichle helped me a lot by answering my boring questions and I finally understood it. I started the coding and within a few days, a first experimental version was born. Not only that I had implemented the lists, I also inserted a separator and a flexible numbering of the theorems.
After a long period of testing, I wanted to share the new features with other TeX-Freaks and wrote an article for the “Die TeXnische Komödie” (Journal of german tug, DANTE e.V.). As soon as I had sent the article to DANTE, I got first reactions on the style. Gerd Neugebauer gave me many hints. I hided several cryptical notations in easy definitions and improved the user interface.

In January 1997, I released “newthm” to the world and it was uploaded to the CTAN-Archives. Few days later I sent my files to Frank Mittelbach in order to show him my extensions. He told me, that already other extensions were made, and that it would be good to combine alltogether.

8.3 Let’s come together

With version 0.8, in February 1997, the combination of thmmarks.sty with newthm.sty to ntheorem.sty has been started. On April 21, 1997, version 0.94 beta has been made public as version 1.0.

In course of the development, the following changes were made:

v0.80
General: Started integration of ‘thmmarks.sty‘ with ‘newthm.sty‘: .......... 1
\theoremstyle: ‘theoremseparator’ added (WM) .......... 42

v0.81
\theoremstyles: ‘theoremmark’ and styles ..No added (WM) .......... 41

v0.82
\newtheorem: fixed, for bold math in headers (AS) .......... 45
General: added ‘AtEndDocument’-Hook for lists (AS) ....... 59
\theorems: fixed greek numbering for bold headers (AS) .......... 59

v0.84
General: added ‘ntheorem.cfg’ feature (AS) .......... 60
moved standard-theorems to extra file (AS) .......... 60

v0.85
General: replaced ‘bf’ by corresponding \TeX2e-commands (AS) .......... 1
\newtheoremlisttype: added (AS) 56

v0.86
\newcommand: added (AS) 56

v0.87
General: option ‘thmmarks’ added (WM) .......... 24

v0.88
Renamed style to ‘ntheorem.sty’ (WM) .......... 1

v0.89
\addtheoremline: added (AS) ... 58
\addtotheoremlines: added (AS) . 58
\listtheorems: fixed a bug for lists (AS) .......... 57

v0.90
\endeqnarray: fixed endmark for ‘eqnarrays’ (WM) .......... 26
\addtheoremlines: added (AS) ... 58
\addtotheoremlines: added (AS) . 58
\listtheorems: fixed a bug for lists (AS) .......... 57

v0.91
\endeqnarray: fixed endmark for ‘eqnarray’ (WM) .......... 26

v0.92
\listtheorems: made commands global in order to handle tabular-lists (AS) .......... 57
\newtheoremlisttype: added error-handling (AS) ............... 56
\theoremlisttype: added error-handling (AS) ............... 56
\thm@enablelistoftheorems: renamed (AS) .................. 57
\newenvironment: added error-handling (AS) ............... 56
\renewenvironment: introduced 'renewenvironment' (WM) .... 47
\@xthm: defined counter only if not yet defined (WM) ........ 49
\@ythem: 'definecounter' only if not yet defined (WM) ....... 50
\newtheoremstyle: 'newtheoremstyle' only if not yet defined (WM) ........ 40
\renewenvironment: introduced 'renewenvironment' (WM) ....... 45
\renewtheoremlisttype: introduced 'renewtheoremlisttype' (WM) ........ 56
\renewtheoremstyle: introduced 'renewtheoremstyle' (WM) ....... 40
\@endtheorem-thmmarks: 'setendmarktrue' globalized (WM) ....... 28
\endmathdisplay: end mark with raisebox (WM) ............... 39
\NoEndMark: 'NoEndMark' introduced (WM) .................... 29
\theorempreskipamount: 'theorempreskipamount' fixed (WM) ....... 42
\v0.93
\@newtheorem: check if definable star-env. added (WM) ....... 45
newcounters only if not yet defined (WM) ..................... 45
\@renewtheorem: introduced 'renewtheorem' (WM) ............. 47
\@xnthm: @definecounter only if not yet defined (WM) ........ 49
\@ynthm: 'definecounter' only if not yet defined (WM) ....... 50
\v0.94
\@endtheorems-thmmarks: 'setendmarktrue' globalized (WM) ....... 28
\v1.00
General: First official version, not changed against 0.94 (WM) .... 1
\v1.01
General: changed some 'def' to 'gdef' and 'edef' to 'xdef' in 'newtheorem' and related macros (WM) .................... 1
\v1.02
\@newtheorem: fixed collision at '@thm', introduced 'setparsms' and 'mkheader' (WM) .................... 45
\@othm: fixed collision at '@thm', introduced 'setparsms' and 'mkheader' (WM) .................... 48
\@nthm: fixed collision at '@thm', introduced 'setparsms' and 'mkheader' (WM) .................... 49
\v1.03
\@ynthm: fixed collision at '@thm', introduced 'setparsms' and 'mkheader' (WM) .................... 50
\amsthm: proof-environment fixed (WM) ..................... 43
\v1.04
\endtabbing: added 'endtabbing' (WM) ..................... 27
\v1.1
\@othm: added 'output' to '@othm', (WM) .................... 48
\@ynthm: added 'output' to '@ynthm', (WM) .................... 49
\@ythem: 'definecounter' only if not yet defined (WM) ....... 50
\\v1.05
\amsthm: proof-environment fixed (WM) ..................... 50
\v1.11
General: added 'noconfig' option (AS/WM) ..................... 39, 60
\v1.12
\@othm: fixed a bug in '@output' (WM, reported by David Epstein) ............... 48
\math@cr@@@align: dropped redefinition of 'math@cr@@@align' (WM, reported by Frank-Christian Otto) ............... 37
\v1.13
\thref: made 'thref' an option. (WM) ..................... 34
\v1.15
\amsthm: proof-environment fixed (WM) ..................... 40
\v1.16
\@newtheorem: introduced 'th@class' (WM) .................... 45
\SetEndMark: extended for handling right indents (quote) (WM) ............... 29
removed tilde in hbox (WM) ............... 29
8.4 Acknowledgements

This place is dedicated to all those, who helped us developing our separate styles and this combined package. Thanks to (listed in alphabetical order):

Donald Arseneau, Giovanni Dore, Oliver Karch, Frank Mittelbach, Gerd Neugebauer, Heiko Oberdiek, Boris Piwinger, Bernd Raichle, Rainer Schöpf, Didier Verna.
