## CSCI 1120 (Low-Level Computing), Fall 2016 Homework 2

Credit: 5 points.

## 1 Reading

Be sure you have read the assigned readings for classes through 8/31.

## 2 Honor Code Statement

Please include with each part of the assignment the Honor Code pledge or just the word "pledged", plus one or more of the following about collaboration and help (as many as apply).<sup>1</sup> Text in italics is explanatory or something for you to fill in. For written assignments, it should go right after your name and the assignment number; for programming assignments, it should go in comments at the start of your program.

- This assignment is entirely my own work.
- This assignment is entirely my own work, except for portions I got from the assignment itself (some programming assignments include "starter code") or sample programs for the course (from which you can borrow freely that's what they're for).
- I worked with names of other students on this assignment.
- I got help with this assignment from source of help ACM tutoring, another student in the course, the instructor, etc.
- I got significant help from outside source a book other than the textbook (give title and author), a Web site (give its URL), etc.. ("Significant" here means more than just a little assistance with tools you don't need to tell me that you looked up an error message on the Web, but if you found an algorithm or a code sketch, tell me about that.)
- I provided significant help to names of students on this assignment. ("Significant" here means more than just a little assistance with tools you don't need to tell me about helping other students decipher compiler error messages, but beyond that, do tell me.)

## 3 Programming Problems

Do the following programming problems. You will end up with at least one code file per problem. Submit your program source (and any other needed files) by sending mail to bmassing@cs.trinity.edu with each file as an attachment. Please use a subject line that mentions the course and the assignment (e.g., "csci 1120 hw 2" or "LL hw 2"). You can develop your programs on any system that provides the needed functionality, but I will test them on one of the department's Linux machines, so you should probably make sure they work in that environment before turning them in.

<sup>&</sup>lt;sup>1</sup>Credit where credit is due: I based the wording of this list on a posting to a SIGCSE mailing list. SIGCSE is the ACM's Special Interest Group on CS Education.

1. (5 points) Write a C program to convert seconds into years, days, hours, minutes, and seconds. Your program should prompt the user for a number of seconds, get the number entered, and print the equivalent number of years, days, etc. (e.g., 100 seconds is 0 years, 0 days, 0 hours, 1 minute, and 40 seconds). Assume 365 days in a year (not quite right but makes the calculations simpler). For this assignment only, you do not need to do any kind of checking that what the user enters is actually an integer and non-negative, since we haven't yet talked about conditional execution. Just assume it is and do the required calculations.

*Hint:* Probably the best way to do the required calculations is with integer-division (/) and remainder (%) operators.
