- Reminder: Homework 6 design due today, code Thursday.

- Reminder: Quiz 5 Thursday.

- Sample programs page has additional examples of multithreaded programs.

Slide 1

Recursion — Overview

- Basic approach:
  - Identify "base case" — something you can solve directly.
  - Figure out how to decompose non-base cases into "smaller" problems, and apply algorithm to smaller problems.

- How to think about "does it work?"
  - Does it work for base case(s)?
  - Assuming recursive calls work, does it work for other cases?
  - Does every recursive call get you at least one step closer to a base case?

- Implementation — conceptually (and usually in fact) involves a stack of calls-in-progress.

- Can be slower than iteration (though sometimes not), but can also be much easier to understand.

Slide 2

Recursion — Simple Examples

- Factorial function.

- Function to compute Fibonacci numbers (very slow!).

Slide 3

Recursion — More Examples

- Linked list implementation.

- Quicksort — pick "pivot" element, split array into elements less than pivot and elements greater than pivot, and sort recursively. Why does this work?

- Mergesort — split array (or list) into two pieces of equal size, sort recursively, merge. Why does this work?

Slide 4

Minute Essay

Slide 5

- Given the following function

```
// assume n >= 0, m >= 0
int foo(int n, int m) {
  if (n == 0) return m;
  else return 1 + foo(n-1, m);
}
```

- What is `foo(3, 5)`?

- What (in words) does `foo` do?

Minute Essay Answer

Slide 6

- `foo(3, 5)` is 8.

- `foo` adds its two arguments.
