

Minute Essay From Last Lecture

• Difficult: Getting re-acclimated to C. (That was partly the point of the assignment — one more opportunity to practice with the language.) Also figuring out exactly what parameters to pass to the system-call library functions, and doing string parsing in C.

- Interesting: How many system calls are needed for even simple programs. (That also was partly the point of that problem.)
- (There were some other responses, but these stood out.)

Words of Wisdom?

• A very smart person I know once said the only interesting part of an o/s course was concurrent algorithms (to be covered soon), and the rest is "just details".

A student a few years ago said "a lot of this just seems like common sense" (once you understand the basic ideas).

Both sort of right ...

- Goal of this course is to learn/retain basic ideas. Details may help with that and can be interesting in themselves — but should not be the focus.
- (Both things to keep in mind as you continue reading and we continue discussing ...)

Process Abstraction

- We want o/s to manage "things happening at the same time" applications, hidden tasks such as managing a device, etc.
- Key abstraction for this "process" program plus associated data, including program counter.

Slide 4

 True concurrency ("at the same time") requires more than one CPU (more properly now, "more than one CPU/core"?). Can get apparent concurrency via interleaving — model one virtual CPU per process and have the real processor switch back and forth among them ("context switch").

(Aside: In almost all respects, this turns out to be indistinguishable from true concurrency. "Hm!"?)

 Can also associate with process an "address space" — range of addresses the program can use. Simplifying a little, this is "virtual memory" (like the virtual CPU) that only this process can use. More (lots more) about this later. (Nitpick: Yes, we also want to be able to share memory among processes. More about that later too.)

Slide 5

• How to map this to the real hardware? in this chapter we talk about how to share the real CPU(s) among processes; in the next chapter we talk about how to share the real memory.
