

CSCI 3323 (Principles of Operating Systems), Fall 2020

Homework 5a

Credit: 20 points.

1 Reading

Be sure you have read, or at least skimmed, Chapter 4.

2 Problems

Answer the following questions. You may write out your answers by hand and scan them, or you may use a word processor or other program, but please submit a PDF or plain text via e-mail to my TMail address. (No links to shared files on Google Drive please.) Please use a subject line that mentions the course and the assignment (e.g., “csci 3323 hw 5a” or “O/S hw 5a”).

1. (5 points) Consider a digital camera that records photographs in some non-volatile storage medium (e.g., flash memory). Photographs are recorded in sequence until the medium is full; at that point, the photographs are transferred to a hard disk and the camera’s storage is cleared. If you were implementing a file system for the camera’s storage, what strategy would you use for file allocation (contiguous, linked-list, etc.) and why? Note that this camera does not have the ability to delete photographs from its storage one at a time, so your file system does not need to support that. (It’s probably best to think of this as a somewhat hypothetical problem, using only the description supplied, rather than trying to extrapolate from any experience you have with actual cameras.)
2. (5 points) The textbook describes more than one strategy for keeping track of free blocks in a file system (free blocks, bitmaps, and FATs). All of these strategies rely on information that is kept both on disk and in memory, sometimes with the most-current information only in memory. What would happen if the copy on disk of whatever data structure is used to keep track of free blocks was lost or damaged because of a system crash — is there a way to recover, or do you have to just reformat the disk and hope you backed up any really important files? Answer separately for systems using a FAT (such as MS-DOS FAT-16) and systems using i-nodes and a free list or bitmap (such as UNIX V7).
3. (5 points) Linux includes code to access several types of Windows filesystems, including FAT-32. So on a system where one of the disk partitions holds a FAT-32 filesystem, one can configure Linux to access this filesystem, through pathname `/windows/fat` for example. However, all the files in `/windows/fat` appear to be owned by user `root`, and attempts to change their ownership (with the `chown` command) fail with an error message “Operation not permitted”. This happens even when the user trying the command is `root` (a.k.a. the superuser). What’s wrong?
4. (5 points) Section 4.5.2 describes a UNIX filesystem in which each i-node contains 10 direct entries, one single indirect entry, one double indirect entry, and one triple indirect entry. If a block is 1KB (1024 bytes) and a disk address is 4 bytes, what is the maximum file size, in KB? (*Hint:* Use the blocksize and size of disk addresses to determine how many entries each indirect block contain.)

3 Pledge

Include the Honor Code pledge or just the word “pledged”, plus *at least one of the following* about collaboration and help (as many as apply).¹ Text *in italics* is explanatory or something for you to fill in. For programming assignments, this should go in the body of the e-mail or in a plain-text file `pledge.txt` (no word-processor files please).

- This assignment is entirely my own work. (*Here, “entirely my own work” means that it’s your own work except for anything you got from the assignment itself — some programming assignments include “starter code”, for example — or from the course Web site. In particular, for programming assignments you can copy freely from anything on the “sample programs page”.*)
- I worked with *names of other students* on this assignment.
- I got help with this assignment from *source of help — ACM tutoring, another student in the course, the instructor, etc.* (*Here, “help” means significant help, beyond a little assistance with tools or compiler errors.*)
- I got help from *outside source — a book other than the textbook (give title and author), a Web site (give its URL), etc..* (*Here too, you only need to mention significant help — you don’t need to tell me that you looked up an error message on the Web, but if you found an algorithm or a code sketch, tell me about that.*)
- I provided help to *names of students* on this assignment. (*And here too, you only need to tell me about significant help.*)

4 Essay

Include a brief essay (a sentence or two is fine, though you can write as much as you like) telling me what if anything you think you learned from the assignment, and what if anything you found found interesting, difficult, or otherwise noteworthy. For programming assignments, it should go in the body of the e-mail or in a plain-text file `essay.txt` (no word-processor files please).

¹ Credit where credit is due: I based the wording of this list on a posting to a SIGCSE mailing list. SIGCSE is the ACM’s Special Interest Group on CS Education.
