ACM Programming Competition
One of my favorite recursive algorithms is maze solving. This is a special case of graph traversals which are common problems in CS.

We'll use a 2D array of ints as our maze and we can even put this into our drawing program.

A simple warm-up piece of code is flood fill like you would have in a drawing program.

Once we have that we can see how to convert it to do things like find the shortest path through a maze or count all paths through a maze.

We can try to make this nice and graphical as well so it fits properly into our drawing program.
Another one of my favorite recursive algorithms is formula parsing. This allows us to have the user type in a function and our code can evaluate it.

We do this through “divide and conquer”. We split the formula in two across the lowest precedence operator then recursively evaluate the two halves.

We can use this to put function plotting or animation into our program if we give it the ability to handle a variable.
Do you have any questions about recursion? Do you see how it can do things like search a space of possibilities or divide up a problem?

The design for assignment #5 is due Thursday.

Interclass Problem - Write a recursive function that does something we haven't done in class.
